Hawaii's Interagency Biosecurity Plan

is a coordinated path forward to increase support for local agriculture, protection for our environment, and safeguards for the health and lifestyle of Hawaii's people.

Biosecurity is the set of measures taken to manage the risk from invasive species to the economy, environment, and health and lifestyle of the people.

Agency Review Public Review Final Interagency Biosecurity Plan

BIOSECURITY IN 2016: Where are we now?

Hawaii's biosecurity comprises many components and is the work of multiple state, federal, and county agencies and partners. Although the Hawaii Department of Agriculture (HDOA) is the only agency with a mandated biosecurity *program*, this biosecurity *plan* recognizes that HDOA is not alone in protecting Hawaii's agriculture, environment, and people from the impacts of invasive species. Key players in Hawaii's biosecurity also include the Hawaii Department of Land and Natural Resources (DLNR), Hawaii Department of Health (DOH), and University of Hawaii (UH).

HDOA regulates domestic import, border inspections, postborder detection, and control of agricultural pests. **Gaps:** lack of data management technology and inspection facilities, not fully equipped biocontrol lab, restrictions on types of commodities inspected, and insufficient staff.

DLNR detects and controls invasive species in natural areas, controls invasive algae, and regulates ballast water. **Gaps:** lack of authority to regulate invasive organisms attached to ship hulls and lack of capacity to detect and control invasive algae, weeds, and predators in our waters and forests.

DOH regulates vectors of human diseases, including mosquitoes. **Gaps:** operating at 60% of the capacity needed to fight diseases such as dengue, Zika, and chikungunya.

UH assists farmers and landowners with pest management through its cooperative extension services, Invasive Species Committees, and Watershed Partnership that control invasive species statewide. **Gaps:** lack of stable funding for agricultural and invasive species programs.

Private industry and the public provide expertise to shape policies and are critical in ensuring that best management practices are followed. Farmers, nursery growers, ranchers, members of the airline and shipping industries, and the general public are important biosecurity partners. **Industry gaps:** insufficient infrastructure for handling inspected cargo; lack of a forum for engaging industry in decision making; and insufficient outreach and assistance to farmers, growers, and the public.

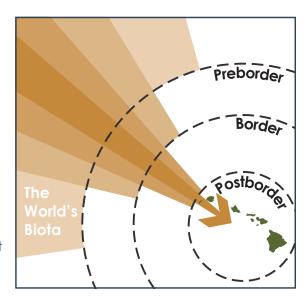

Federal agencies such as U.S. Department of Agriculture, Center for Border Protection, and U.S. Fish and Wildlife Service play a key role in Hawaii's biosecurity. They regulate foreign imports and provide technical and funding support to state and private landowners to manage invasive species.

BIOSECURITY IN 2027: Where are we headed?

Effective biosecurity requires a comprehensive approach that includes:

- Pre-border policies and processes to prevent invasive species from making their way to Hawaii
- Border policies and processes that support inspecting incoming items to ensure minimal risk of pest entry into the state
- Post-border policies and processes that support detecting and responding to new incursions of invasive species and controlling established invasive species wherever possible

This plan addresses Hawaii's most critical biosecurity gaps and provides a coordinated, interagency path to a more secure future. It identifies more than 100 policy, process, and infrastructure actions that Hawaii's state, federal, and county agencies and partners can take. The following 10 highlights are key to the success of this plan:

Off-shore compliance: Agreements with other jurisdictions to adopt preshipping inspection and control policies

E-manifest and intelligence gathering: New technology to track

gathering: New technology to track what is coming in, what is high risk, and what is low risk (for faster release)

Inspection facilities: Well-lit, secure areas for efficient inspections, refrigerated areas for produce

Inspection of nonagricultural items: Provide HDOA the authority and staff to inspect high-risk nonagricultural items

Emergency response capacity: Interagency plans, protocols, and funding in place for timely and effective response to new pest incursions

Better coordination and participation by industries: Expansion of the Hawaii Invasive
Species Council into the Invasive Species
Authority to provide industry a seat at the
table and better interagency coordination to

monitor, detect, and control invasive species

Renewed focus on human health: A fully restored DOH Vector Control Branch to detect vectors of dengue, Zika, and more

Enhanced control of established pests: Adequate field staff at HDOA, DLNR, DOH, and UH to control established invasive species, improved laboratories to support effective biocontrol

Minimized interisland spread: Increased staff and inspections for interisland goods, support to local farms and nurseries through certification programs and import substitution programs

Engaged and supportive community:
Targeted outreach to different stakeholder groups to increase awareness of and engagement in biosecurity programs

Our biosecurity vision is for Hawaii's people, visitors, economy, agriculture, and natural environment to be protected from the impacts of invasive species. Achieving this vision will require hard work, policy development, and financial commitment. This vision is achievable if we work together.

No'eau: Hawaiian Proverbs &
Poetical Sayings

Traditionally, native Hawaiians firmly believe that land and ocean are one and that together they provide everything needed for man to survive. Therefore, it is our kuleana (responsibility) to steward the land so that it may provide the necessary resources for generations to come. We would like to start by first acknowledging our kupuna (ancestors), who were the original land stewards and

who helped to lay the foundation, teaching us by example to malama (care for) all that sustains life.

We also acknowledge the current land stewards who work tirelessly to continue the work of those who came before us. This group, represented by the many hands in agriculture, ranching, aquaculture, and nurseries and by conservationists throughout the state, is committed to protecting the natural and cultural resources that sustain their industries and our local water and food sources. As a community, we must support these industries and protect them from the harmful effects of invasive species. We believe that the Hawaii Interagency Biosecurity Plan is a necessary tool to support these industries.

This plan was conscientiously developed through extensive participation from members of the public and private sectors and the larger community. They provided invaluable input during development of the Hawaii Interagency Biosecurity Plan. We would like to acknowledge the following public and private sector agencies and organizations that participated in the stakeholder workshops.

Definition of Key Terms

Term	Definition
Aquatic invasive species	A nonindigenous aquatic species that, if introduced into an ecosystem, may cause harm to Hawaii's economy, environment, human health, or public safety and welfare.
Biosecurity	The set of measures taken to manage the risk from invasive species to the economy, environment, and health and lifestyle of the people.
Border	Encompasses all the policies, protocols, and processes put in place to detect and respond to the arrival of an invasive species at the ports of entry (into the state) or at the regulated place of entry (into the state). The border is the area bounded either by the inspection areas (inside the walls or inside the fence) at ports of entry from mainland or foreign countries or by the extent of regulations governing importation from mainland or foreign countries. It is a very confined physical area/area of responsibility. Anything that is not covered by import regulations or is found outside the physical boundary of the port is "postborder." "Border" would include facilities that are mandated (by border regulations) to deal with goods as if they are at the border, including off-site inspection facilities, containment facilities, plant quarantine facilities. "Border" is about facilities, regulations and inspection.
Foreign animal disease	An important transmissible livestock or poultry disease believed to be absent from the United States and its territories that has a potential significant health or economic impact. Diseases may be emerging diseases or internationally recognized diseases that are endemic in countries outside the United States.
Interception	The finding of a pest associated with a commodity or a shipping container. A single commodity infested with various species of insects is a single interception, but after it is determined to have multiple species, each species is associated with the interception on which it was originally found. If three different species of insects are found in the shipment, then it is logged as three interceptions. There may be one or many individuals of each of the three species, but they are logged as only three interceptions. These three insect species may be on the same commodity or on different commodities in the same shipment. If the same insect species are found in a different shipment on the same day, they are regarded as three separate interceptions. ¹
Invasive species	An alien species whose introduction does or is likely to cause economic or environmental harm or harm to human health. This is the federal definition of invasive species from Executive Order 13112. Invasive species is a nonregulatory term, and the state has several regulatory designations that are related to but not synonymous with the term, including pest, noxious weed, and injurious wildlife.
Pathway	The means by which an invasive species is transported from one location to another. Movement of species can be via natural pathways, which include wind, water, or attachment to animals, or via pathways enhanced or created by human activity. ² Movement of species via human-made pathways can be unintentional (e.g., associated with the importation of fruits and vegetables) and intentional (i.e., the result of deliberate actions to translocate organisms).
Pest	As defined by Hawaii Revised Statutes Chapter 150A, "any animal, insect, disease agent or other organism in any stage of development that is

Term	Definition			
	detrimental or potentially harmful to agriculture, or horticulture, or animal or public health, or natural resources including native biota or has an adverse effect on the environment."			
Postborder	The area that a pest is found in once it has passed the point or opportunity of border inspection, whether it was or was not detected. Postborder encompasses all the policies, protocols, and processes put in place to eradicate or control an invasive species beyond the ports of entry and inspection process. The issue of interisland biosecurity and transport of species within an island is covered under the theme of postborder security.			
Preborder	Encompasses all the policies, processes, and protocols put in place to prevent entry of an invasive species into Hawaii.			
Risk	Is discussed in several places in this document in the following contexts: pest risk analysis: pest risk assessment; biosecurity risk: or high-risk pest, species, taxa, commodity, or pathway. Simply put, risk is the chance of an adverse event happening and the consequences if it happens. Risk analysis is a systematic way of gathering, evaluating, and recording information leading to recommendations for a position or action in response to an identified hazard. Pest risk analysis is a form of risk analysis conducted by regulatory plant health authorities like the various countries' national plant protection organizations, U.S. Department of Agriculture Animal and Plant Health Inspection Service, and the International Plant Protection Convention (IPPC) as a systematical approach to decide whether a pest should be allowed to enter (a country, region, or state) or managed using legislation. Pest risk analyses identify appropriate phytosanitary measures to protect plants against new or emerging pests. Pc defines Pest risk analysis as "the process of evaluating biological or other scientific and economic evidence to determine whether a pest should be regulated and the strength of any phytosanitary measures to be taken against it. "4 IPPC's Pest risk analysis is a formal three-step process that involves: 1. hazard identification (what is the adverse event that we are afraid will happen?), 2. risk assessment (what information is available, what is the quality and quantity of information, what is the probability, and what is the magnitude of consequences?), and 3. risk management (what can be done to eliminate the hazard, how feasible and effective are the options, what impacts do the options have, and what is the level or type of uncertainty?). Hawaii Department of Agriculture (HDOA) in general follows the widely accepted science-based international guidelines on risk analysis. There is no state policy that mandates HDOA to adopt a specific pest risk analysis framework. For example, the Kahului Airport Risk Assessment			

Term	Definition
Vessel	The word "vessel" includes every description of watercraft or other artificial contrivance used, or capable of being used, as a means of transportation on water (Title 1 United States Code, Chapter 1, Section 3).

Section 1.0 Vision

Hawaii's people, visitors, economy, agriculture, and natural environment are protected from the impacts of invasive species.

With strong leadership across all partner agencies, legislative support, and a commitment to fund the implementation tasks identified in this Hawaii Interagency Biosecurity Plan (HIBP), biosecurity by 2027 is envisioned to contribute to a wide range of positive outcomes for Hawaii's economy, its environment, and the health and lifestyle of its people. We will know biosecurity is working when:

- 1. Farmers, ranchers, aquaculturists, and plant nursery growers experience reduced risk to production, broaden local and export markets, and receive effective support to detect and control pests.
- 2. Commodities shipped to Hawaii are cleaner, with less pest contamination, because agreements with other state, federal, and international authorities have produced better prevention strategies, such as offshore screening and certification of commodities.
- 3. Border inspection of higher-risk items is more efficient and lower-risk items are released more quickly because the Hawaii Department of Agriculture (HDOA) uses state-of-the-art data management systems, electronic manifesting (emanifesting), and enhanced intelligence gathering.
- 4. The chance of pests entering Hawaii is reduced because HDOA has the authority to inspect nonagricultural commodities it determines to be of higher risk.
- 5. Hawaii's primary industries are more secure because an increase in HDOA staffing allows for increased border inspection; more data gathering to inform risk assessments; and increased postborder support to local agricultural, aquaculture, and landscape industries to manage risks from invasive species.
- 6. Inspection efficiency improves because HDOA has inspection facilities that are secured, well lit, and equipped with the tools to detect and treat infected materials.
- 7. Human diseases, such as dengue, Zika, and rat lungworm disease, pose a lower risk because the fully restored Vector Control Branch of the Hawaii Department of Health (DOH) is better able to detect vectors of disease before they become a human health hazard.
- 8. Aquatic Invasive Species (AIS) are less likely to arrive and spread by means of ballast water or by attaching to the hull of vessels because specific regulations and best management practices are in place to protect Hawaii's waters.
- 9. Invasive algae and other established AIS are effectively contained and controlled by applying improved control technologies and enhanced efforts to control and monitor their distribution.

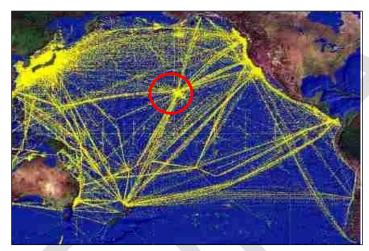

- 10. HDOA's biocontrol program has adequate resources, including state-of-the-art biocontrol facilities, and is equipped to develop effective biocontrol for some of Hawaii's high-impact and widespread invasive species that are difficult to control through conventional methods.
- 11. Natural resources, including native biodiversity, are better protected on public and private lands because established invasive species are effectively controlled and reduced.
- 12. Incipient invasive species are detected and eradicated in a timely manner on public and private lands because the capacity for early detection and rapid response has increased.
- 13. Invasive species are less likely to spread from one island to another because multiple mechanisms are in place, such as monitoring for early detection, adequate rapid response capacity, keeping better records, increasing the number of inspections, and implementing interisland nursery certification and pest treatment programs.
- 14. Hawaii's residents take pride in our biosecurity system, recognize it as an essential service, are more knowledgeable about the islands' biosecurity system, and support and engage in activities that improve it.

Expected Overall Changes:

- 1. Hawaii's unique biosecurity needs are addressed at the local, national, and international level.
- 2. Biosecurity is better understood as the shared responsibility of many agencies and partners coordinating their work on preborder, border, and postborder issues across multiple sectors.
- 3. Agencies are aligned with the biosecurity vision, they are fully committed to and accountable for delivering on their tasks, and efforts to manage invasive species from preborder to postborder are well coordinated and effective.
- 4. Hawaii's current and emerging biosecurity risks are better understood by private industry stakeholders and the public, and both of these groups are engaged in developing solutions to biosecurity threats to the islands
- 5. Agencies have the necessary policy, funding, expertise, and staffing to deliver on their biosecurity responsibilities.
- 6. State-of-the-art technology and infrastructure are available to protect Hawaii from the impact of invasive species.

2.1 Need for and Purpose of the Hawaii Interagency Biosecurity Plan

In 2001, the Hawaii legislature found that "the silent invasion of Hawaii by alien invasive species is the single greatest threat to Hawaii's economy, natural environment, and the health and lifestyle of Hawaii's people and visitors" (Senate Concurrent Resolution 45, H.D. 1 [2001]). Although many governmental organizations and Nongovernmental Organizations (NGOs) implement components of biosecurity through several invasive species management and research programs, Hawaii has not addressed its unique biosecurity needs in a coordinated and comprehensive manner. Three primary factors are highly relevant here: (1) Hawaii is extremely vulnerable to biological invasions; (2) the spectrum of dominant endemic/native plant species in Hawaii differs from that found in the rest of the United States; and (3) Hawaii imports more than 80% of all its goods and approximately 90% of its food (HDOT 1997, Lueng and Loke 2008).

Shipping routes (yellow lines) highlight that Hawaii (circled in red) is a major transportation hub in the Pacific. Incoming ships bring not only goods we depend on but also harmful pests from all over the world. Faster and larger means of transportation over the years have dramatically increased the rate of nonnative species reaching Hawaii. (Map credit: T Gilbert, World Meteorological Organization, and NOAA)

Hawaii's susceptibility to invasions is dramatically illustrated by the fact that nearly as many nonnative terrestrial arthropod species are established in Hawaii as in the other 49 states of the United States combined. How can this be possible, and why is it the case? A consultant's report to the U.S. Department of Agriculture (USDA) (McGregor 1973) recognized that innate characteristics of Hawaii seem to make agricultural quarantine more difficult: "[For insects and mites] in the period 1942-72 the rate of colonization per thousand square miles was 40 species, 500 times the rate of continental United States," in spite of a larger quarantine force in relation to volume of

commerce. He speculated on possible reasons: "Although there is much greater diversity of crops and habitats within the continental United States, these are dispersed over a vastly larger land area. In Hawaii . . . the various habitats are more readily accessible from the principal port of entry. The more moderate and stable climate is also more favorable for an invading species than is the climate over much of the United States."

The U.S. Forest Service (USFS) (DeNitto et al. 2015) spent 4 years responding admirably to the Hawaii Division of Forestry and Wildlife's (DOFAW's) request to analyze the risk to 13 Hawaiian species/genera that dominate our ecosystems and provide habitat for the rest of Hawaii's biota, including most threatened and endangered species. The agency documented many threats to those species/genera from invasive species not yet present in

Hawaii. With the combination of such impending threats and the islands' extreme vulnerability to biological invasions (discussed above), Hawaii needs to actively pursue more protection from interstate and international threats.

Hawaii should protect itself much better than it currently does. It is common practice to import propagative plant material to Hawaii for finishing and resale because it is much cheaper than self-propagation. At the same time, importation of propagative plant material is recognized as one of the main pathways for the introduction of pests such as coqui frogs (Eleutherodactylus coqui), nettle caterpillar (Darna pallivitta), ohia rust (Puccinai psidii) and Rapid Ohia Death (Ceratocystis fimbriata) (Burnett and Coffman 2015, DeNitto et al. 2015, Rago and Sugano 2015). To mitigate the risk associated with importing propagative plant materials, HDOA could enhance import requirements by requiring phytosanitary certificates for host plants.

Agricultural inspectors examine imported cut flowers. Importation of plant material is one of the main pathways for the introduction of harmful pests and diseases. (Source: HDOA)

USDA's Animal and Plant Health Inspection Service (APHIS) and the U.S. Department of Homeland Security (DHS), Customs and Border Protection (CBP), are primarily responsible for intercepting pests from foreign points of origin. HDOA is the first line of defense against invasive species entering our state from domestic points of origin, and as discussed in Section 2.2, it is the only state agency mandated to implement a biosecurity program. However, the impact of invasive species in Hawaii is wide ranging, so in addition to HDOA, several federal, state, and county agencies and nonprofit organizations are working to prevent the entry of invasive species into Hawaii and the spread of these species in the state.

The following agencies and organizations are among those focused primarily on biosecurity issues in Hawaii:

The Hawaii Department of Agriculture (HDOA) is mandated to implement Hawaii's biosecurity program. The Plant Industry (PI) and Animal Industry (AI) Divisions are primarily involved in implementing this program. The PI Division plays an important role in inspecting cargo and passengers at all ports of entry for the importation of potentially harmful pests and regulates the importation and possession of nondomestic animals and microorganisms. Through its Plant Quarantine (PQ) Branch, Plant Pest Control (PPC)

Branch, and Pesticides Branch, the PI Division also protects Hawaii's agricultural industries, natural resources, and the public from the entry and establishment of detrimental plants, animals, insects, weeds, plant diseases, and other pests. In addition, it ensures the safe and efficient use of pesticides in Hawaii. The PI Division also promotes expansion of Hawaii's agriculture and horticulture by overcoming quarantine restrictions. The AI

Division safeguards the state's livestock and poultry industries by controlling and preventing the entry and spread of livestock pests and diseases; operating the rabies quarantine program and the airport holding facility; conducting investigations into violations of animal quarantine or animal importation statutes; and providing veterinary laboratory support for diagnosing animal diseases.

The Hawaii Department of Land and Natural Resources (DLNR) is the state agency mandated to enhance, protect, conserve, and manage Hawaii's unique and limited natural, cultural, and historic resources held in public trust. DLNR, primarily through DOFAW and the Division of Aquatic Resources (DAR), administers various programs for the management of established invasive species in Hawaii's natural areas.

The **Hawaii Department of Health (DOH)** is the state agency with the mission to protect and improve the health and environment for all the people in Hawaii. DOH through its Vector Control Branch works with other state and federal partners to ensure that human diseases and vectors of those diseases do not become established in the islands.

The University of Hawaii (UH) supports biosecurity primarily through academic research and cooperative extension services. UH's College of Tropical Agriculture and Human Resources (CTAHR) Cooperative Extension Services (CES) is a partnership among federal, state, and local governments and has responsibility for providing science-based information and educational programs in agriculture, natural resources, and human resources. CTAHR CES programs address home and garden projects, commercial

agriculture, natural resources, soils, and invasive species and pest control. Extension agents and specialists directly support local farmers, aquaculturists, floriculturists, and others with research, survey, detection, and management of pest infestations. CES programs also provide agricultural diagnostic services, which include insect identification; disease diagnosis; soil, plant, water, and feed analysis; and support of local production through sales of seeds of vegetable and fruit cultivars developed by the college.

UH's Pacific Cooperative Studies Unit (PCSU) also works cooperatively with private and state and federal land organizations, including The Nature Conservancy, Kamehameha Schools, and DLNR. Its projects range from finding ways to eradicate miconia (*Miconia calvescens*) and other alien invasive weeds to managing watersheds on Maui and Oahu. Often, PCSU works as an intermediary, allowing agencies to pool and coordinate their efforts so that they can attack problems such as invasive species across the landscape at an appropriate scale. For example, PCSU administers the various island-based Invasive Species Committees (ISCs) and the Hawaii Ant Lab (HAL), discussed below.

The mission of the U.S. Department of Agriculture (USDA), Animal and Plant Health Inspection Service (APHIS) is to protect the health and value of American agriculture and natural resources. APHIS has inspectors in Hawaii who screen and inspect agricultural products arriving in Hawaii from foreign ports to stop the entry, establishment, and spread of federally regulated pests in the United States, including

plant pests and noxious weeds. APHIS also has animal health inspectors who respond to threats from foreign animal diseases that may occur domestically or as a result of international movement.

Since 2003, the DHS's CBP, discussed below, has enforced specific quarantines for APHIS's Plant Protection and Quarantine (PPQ) program through a memorandum of agreement. Inspections are conducted, and when insects and diseases are discovered, CBP sends them to a PPQ Hawaii plant inspection station for identification. PPQ retains all records for pest interceptions and other data. Action is taken either by CBP or by PPQ on those pests found to be under regulation. If the pest is found not to be under regulation, no action is taken.

APHIS-PPQ works cooperatively with national and international plant protection organizations; federal, state, and local agencies; universities; industries; and farmers. It focuses on four key elements: preparedness, prevention, response, and recovery. Specific APHIS-PPQ activities include pest exclusion; pest survey and detection; pest eradication; pest management, including the use of biological control; and development of sampling and survey methods for use in field programs.

APHIS-PPQ is the lead federal program for certain plant health emergencies. Working closely with HDOA, PPQ may provide assistance during plant health emergencies in Hawaii, although most actions would require that the invasive species be a federal quarantine pest (as was the case recently in Hawaii for response to the coconut rhinoceros beetle [Oryctes rhinoceros]). PPQ assists in a variety of ways, including by providing identification services; providing funding for technical plant pest survey and detection, monitoring, eradication efforts, and outreach; coordinating with state and local agencies to define quarantine and buffer zones; conducting trace back and trace forward inspections; preparing information for dissemination to the public and targeted concerned groups; and creating increased awareness of invasive plant pests through the dissemination of information and education.

The U.S. Department of Agriculture (USDA), Agricultural Research Service, Pacific Basin Agricultural Research Center (PBARC), in Hilo, Hawaii, has the mission of developing basic and applied information to strengthen agriculture in Hawaii and the Pacific Basin in an environmentally acceptable and sustainable manner, including demonstrating appropriate strategies for managing crop pests and providing

economically viable technologies for controlling quarantine pests. PBARC entomologists and plant pathologists can assist in identifying, detecting, and mitigating invasive species. PBARC scientists also have expertise in quarantine treatments. The agency is making a major contribution to the response to Rapid Ohia Death.

The U.S. Department of Homeland Security (DHS), Customs and Border Protection (CBP), functions at the **Border Protection** international ports of entry in Hawaii, screening and inspecting people and commodities for targeted pests in the United States.

CBP enforces a wide range of biosecurity issues; it enforces mandates from other agencies, including APHIS, the Center for Disease Control (CDC), and the Food and Drug Administration, specifically addressing domestic and nondomestic animals, produce, plants and plant parts, animal products, and foreign garbage. CBP is responsible for air/sea/military passengers/cargo and air and sea conveyance entering the United States from foreign countries. It conducts inspections and retains information relating to the entry of passengers and cargo.

The U.S. Department of Agriculture, Forest Service (USFS), in Hawaii consists of the Institute of Pacific

Islands Forestry (an institute devoted to biodiversity and forestry research) and the Pacific Southwest Region's State and Private Forestry programs. It is based at a facility in Hilo, Hawaii. Although USFS has no national forest land in Hawaii, it conducts research on Pacific island forest management and ecology and provides funding, technical advice, and training to Hawaii and other island forestry programs through its State and Private Forestry programs, such as Forest Health Protection and Forest Stewardship. It also supports a

major biological control effort for seriously invasive weeds (including strawberry guava [Psidium cattleianum] and miconia) in Hawaii and assists state forestry programs addressing plant pests and pest plants by providing forest health evaluations and funding in certain circumstances. USFS is heavily involved with the response to Rapid Ohia Death, caused by the pathogen Ceratocystis fimbriata.

The U.S. Department of the Interior, Fish and Wildlife Service (USFWS), is responsible for protecting

federally endangered species and national wildlife refuges, which in Hawaii are threatened primarily by biological invasions. USFWS Ecological Services maintains an Invasive Species Coordinator at the Pacific Islands Field Office in Honolulu and other Hawaii-based staff members who work on invasive species issues. National wildlife refuges in Hawaii support invasive species control programs as part of their overall habitat restoration activities. USFWS has played a tremendous role in keeping the brown tree snake (Boiga irregularis) out

of Hawaii by working to keep eradication and detection efforts around the airport in Guam funded.

The USFWS Office of Law Enforcement administers the Lacey Act, which prohibits the importation and interstate movement of listed injurious species. USFWS is also responsible for monitoring the import, export, transport, sale, receipt, acquisition, or purchase of any fish or wildlife or plant possessed, transported, or sold in violation of any law, treaty, or regulation of the United States, as well as interstate or foreign commerce of any fish or wildlife taken, possessed, transported, or sold in violation of any law or regulation of any state or foreign law, or plants in violation of any law or regulation of any state.

The U.S. Department of the Interior, National Park Service (NPS), manages seven parks in Hawaii, with protection of biodiversity as a primary goal. Major program components, especially of the larger parks—Hawaii Volcanoes National Park (323,000 acres) and Haleakala National Park (33,000 acres)—have addressed invasive species issues within and outside park boundaries. NPS has financially supported research, management, and outreach related to invasive species both on and off the land for which it is responsible.

The U.S. Department of the Interior, Geological Survey (USGS), Pacific Island Ecosystems Research Center (PIERC), provides scientific leadership in support of national, regional, and local needs to understand, conserve, and manage natural resources in Hawaii and other

Pacific island ecosystems. PIERC strives to help resource managers tackle current and emerging critical conservation issues, primarily issues related to invasive species.

The Coordinating Group on Alien Pest Species (CGAPS) is a statewide coalition of agencies and NGOs working together to protect Hawaii from invasive species. CGAPS was formed in 1995 to bring agencies and organizations together to close the gaps in Hawaii's invasive species programs in the areas of prevention, early detection/rapid response, and long-term control of harmful terrestrial species and AIS.

The Hawaii Invasive Species Council (HISC) was established in 2003 for the special purpose of providing policy-level direction, coordination, and planning among state departments, federal agencies, and international and local initiatives for the control and eradication of harmful invasive species infestations throughout the state and for preventing the introduction of other invasive species that may be potentially harmful. It is an interdepartmental collaboration composed of DLNR; DOH; HDOA; the Hawaii

Department of Transportation (HDOT); the Hawaii Department of Business, Economic Development and Tourism (DBEDT); and UH.

Invasive Species Committees (ISCs) are island-based coalitions of government and nongovernment entities organized under UH's PCSU. They include the Kauai Invasive Species Committee, Oahu Invasive Species Committee, Maui Invasive Species Committee (MISC), Molokai Invasive Species Committee, and Big Island Invasive Species Committee. They provide early detection and rapid response programs to eradicate or contain newly detected invasive species before they become irreversibly

established. The ISCs are well known for their strong public outreach and educate programs tailored to island issues and communities.

Hawaii Ant Lab (HAL) is a specialized invasive ant management unit attached to UH's PCSU. HAL's charter is to develop new ant treatment methodologies, assist affected businesses and residents, and take an operational lead in eradicating invasive ants on all Hawaii's islands. HAL's current focus is preventing the spread of little fire ants (*Wasmannia auropunctata*) and eradicating incipient populations as they are detected.

Hawaii Association of Watershed Partnerships are voluntary alliances of both public and private landowners committed to the common value of protecting forested watersheds for water recharge, conservation, and other ecosystem services through collaborative management. Controlling the introduction and spread of invasive species in Hawaii's watersheds is a core function of the Watershed Partnerships.

What's at Risk?

Hawaii's **agricultural production** totals **\$680 million**¹ annually. The agricultural sector in Hawaii loses approximately **\$300 million**² each year in revenue from **alien fruit fly infestations** alone. Another such pest could inflict similar losses.

The value of the Koolau Mountain forest watershed alone is estimated at \$14 billion³ in combined economic and ecosystem services. A disease like Rapid Ohia Death could wipe out Hawaii's ohia trees, which are a dominant component of our native forests, thereby affecting their capacity to recharge water.

Hawaii's annual **horticultural production** is estimated at **\$69 million**¹. The spread of pests, such as the **chrysanthemum white rust**, could result in further quarantine restrictions on exports and the in-state sale of locally produced flowers and foliage.

Visitors spend **\$14.9 billion**⁴ per year in Hawaii. The outbreak of a human-health disease, such as the **Zika virus**, or the introduction of a nuisance pest, such as biting midges (sandflies), could devastate Hawaii's **tourism economy**.

Little fire ant is estimated to cost Hawaii County alone \$174 million⁵ per year in management costs and economic damage to agriculture, nurseries, residents, and other sectors.

The economic cost of inaction is great, but the potential reduction in quality of life and the potential loss of cultural and environmental resources are unthinkable.

The capacity of individual agencies and organizations to prevent and control invasive species is limited by their regulatory statutes, funds, staffing, expertise, and infrastructure. In spite of efforts by passionate professionals and dedicated staff members to share resources and work collaboratively, actions to solve invasive species problems in Hawaii are often delayed and inadequate, costing Hawaii taxpayers millions of dollars in otherwise preventable control work. Decades of experience with invasive species management and research in the islands, together with lessons learned from New Zealand and Australia (which already have comprehensive nationwide biosecurity systems in place), have highlighted the fact that biosecurity inherently requires the ongoing collaboration of multiple organizations working to protect agriculture, natural environment, and the health and lifestyle of the people. Lack of a cohesive interagency biosecurity plan with clearly mandated agency roles and responsibilities, and dedicated funding to effectively prevent the introduction and spread of invasive species has been identified as a critical programmatic gap in Hawaii's efforts (TNC and NRDC 1992, Warren 2006, HISC 2015).

HDOA has taken the lead to develop this HIBP, but this *plan* does not recreate or revise HDOA's existing biosecurity *program* delivered through its PQ Branch and described by Hawaii Revised Statutes Chapter 150A. This HIBP is a 10-year road map for implementing the infrastructure and capacity needed to support biosecurity *programs* at multiple agencies, including HDOA. A comprehensive perspective on biosecurity in Hawaii certainly includes the PQ Biosecurity Program, but it also recognizes the broader context of preborder, border, and postborder biosecurity measures collaboratively addressed by other federal, state, and county agencies, as well as the private industry and the public.

The goal of this HIBP is to ensure that existing and future biosecurity programs at multiple agencies are well supported, aligned to protect Hawaii from the impacts of invasive species, and effectively implemented by the respective organizations in a synergistic and coordinated manner.

2.2 HDOA Biosecurity Program

This section describes HDOA's current biosecurity program. Act 236 of the Session Laws of Hawaii 2008, created a Biosecurity Program in the HDOA to support the department's efforts in combating invasive species. The objectives of the Biosecurity Program are to (1) establish a multidimensional system to prevent the entry into the state and interisland movement of pests and prohibited or restricted organisms without a permit and (2) respond effectively to eradicate, control, reduce, and suppress incipient pest populations and established pests and seize and dispose of prohibited or restricted organisms without a permit. Actions identified in the statute include establishing preentry inspection programs, operating inspection facilities at ports of entry, controlling pests that have entered the state, providing greater collaboration regarding biosecurity among governmental agencies and industry, developing new tools to collect information on cargo being shipped, supporting local agricultural products to replace imports, and providing public outreach. The statute also established authority for HDOA to set and impose charges for inspection, quarantine, and eradication of pests, with the proceeds deposited into the pest inspection, quarantine, and eradication special fund.

Some of the challenges that HDOA faced in developing its Biosecurity Program were:

- more than 80% of all goods used in Hawaii are imported, and as long as people and cargo are imported, invasive species will be brought into the state through accidental transport;
- invasive species affect all aspects of society, including public health, agriculture, environment, and the economy;
- controlling and eradicating invasive species after establishment can be much more difficult and costly than prevention; and
- invasive species brought in on imported food products affects local agriculture and farmers.

High-volume on-time delivery of parcels and perishable goods coupled with the lack of adequate inspection areas makes inspection difficult at Hawaii's ports and harbors. (Source: HDOA)

To meet these challenges, HDOA developed a broad strategy that included a focus on preventing the movement of pests into the state and between islands, the early detection and rapid control of invasive species if they are introduced, and the control and eradication of those pests causing the greatest harm to the state and its resources. An important initiative of the Biosecurity Program is to promote and encourage local agriculture so as to reduce dependency on imports, which have the potential to introduce new invasive species. HDOA has been working on developing the following capacities for its biosecurity program (HDOA 2007, 2015):

- Prevention—inspections at ports of entry and development of origin certification programs for highrisk commodities
- **Diagnostics**—identification of invasive insects, plant pathogens, and weeds
- Detection—surveillance for the existence and location of an invasive species that have invaded or been introduced
- Rapid response—quick control measures to eliminate individual pest incursions (e.g., snakes), as well as incipient population of an invasive species

- Monitoring—surveys to track the presence and status of introduced invasive species over time and also evaluate efficacy of control programs
- Biological sampling—surveys to track the presence and status of species over time
- Research and development—development of scientific knowledge, methods, and technologies to prevent, detect, control, and monitor invasive species and assist in implementing learned technologies to control invasive species effects on agricultural production and native ecosystems
- Education outreach—actions taken to support public education programs
- Partnerships and cooperative activities—with stakeholders (agricultural industries, conservation groups, the transportation industry) and federal, state, county, and private partners
- Information management—storing and sharing data and databases
- Quality control programs—activities to measure levels of effectiveness
- Quarantine treatment facilities—facilities to conduct disinfestation treatments
- **Permitting**—issuing permits based on statutes, regulations, and prior board (Board of Agriculture) decisions

 Compliance and enforcement—program to compel compliance with quarantine laws and regulations

- Import substitution and Hawaii export programs—substitution of risky imports with locally produced products and promoting export of Hawaii-grown agricultural goods
- Management of high-impact animal diseases—activities to detect and minimize the impact of animal diseases
- Pesticide regulation and use activities to regulate the manufacture, sale, and use of pesticides

Through its Biosecurity Program, HDOA collaborates with the Oregon Department of Agriculture to oversee the inspection of Christmas trees before they are shipped to Hawaii. This practice reduces the number of pests reaching Hawaii and facilitates border inspections. (Source: HDOA)

Some of the projects that have been developed and implemented by HDOA and partners under HDOA's biosecurity program include:

Pilot transitional inspection facilities—a pilot program that demonstrated the usefulness and
effectiveness of conducting inspections at an off-port site owned and operated by private produce
distributors

- Emanifesting pilot project—to allow importers to send an electronic manifest (emanifest) of items being shipped to Hawaii in advance of arrival and enable HDOA to schedule inspections based on the commodity and the level of risk
- Christmas tree inspection project—increase in the duration of inspectors overseeing the project to
 establish best management practices and preshipment inspection protocols for Christmas trees
 shipped to Hawaii annually
- Nursery certification and compliance project—a pilot program for interisland shipments of commodities without inspection if the nursery follows best management practices to reduce risk or eliminate pest infestation
- Survey, early detection, and rapid response projects—survey, early detection, and rapid response for introduced pests and disease, including Rapid Ohia Death, little fire ant, coqui frog, and Africanized honey bee (*Apis mellifera scutellata*)
- Control projects—control via chemical, mechanical, or biological means of high-priority pests such as coqui frog, little fire ant, erythrina gall wasp (*Quadrastichus erythrinae* Kim), and fireweed (*Senecio madagascariensis*) to mitigate their impacts

In 2008, when the Biosecurity Program was implemented, HDOA had 147 positions and a budget of \$10,019,000 for its PQ and PPC programs (SOH 2008). Over the past 8 years, the state has experienced the 2008 recession, a reduction in force, and elimination of vacant positions. The vital PQ and PPC programs were no exception and suffered a loss of 29 positions (26 permanent and three temporary positions): 13 in 2009 (SOH 2009) and another 16 in 2010 (SOH 2010). Since 2010, funding has increased with the establishment of inspection fees in the pest inspection, quarantine, and eradication special fund, and some positions have been restored. However, as of 2016, the PQ and PPC program budget has increased to \$15,404,657, including \$8,428,040 in special funds, but there are still only 121 permanent staff members—a net loss of 26 permanent staff positions from 2008. Over this same period, when HDOA's biosecurity program staff has decreased by 18%, tonnage of incoming air cargo has increased by 34% (1989–2013), and tonnage of cargo moving through Honolulu Harbor has increased by 21% (1988–2014) (DBEDT 2014).

Staff shortages can hinder HDOA's ability to provide systematic scrutiny of all high-risk pathways; spot-check of low-risk pathways; quarterly risk assessments; compliance agreements; rule changes; mitigation programs for the coqui frog, little fire ant, and nettle caterpillar; inspections of military and private jets and boats; interisland inspections; shared data management; nursery monitoring and assistance; monitoring ports for red imported fire ant (HDOA 2007); and additional needed actions, such as interdiction programs for the brown tree snake, canine detection programs, and investigation of violations of quarantine laws and regulations. Adding state staff capacity is essential if HDOA is expected to fully meet its obligations to protect Hawaii from invasive species. This HIBP identifies needed increases in staffing to accomplish these responsibilities, as well as additional implementation tasks identified in this plan. It also identifies the policy changes, resource increases, and

implementation tasks that should be undertaken by other agencies to support and complement the work done for HDOA's Biosecurity Program.

2.3 The Planning Process

As discussed above, components of biosecurity already exist in Hawaii. There is a great deal of literature related to pest risk assessments, invasion pathways, gap analysis and recommendations related to Hawaii's biosecurity measures, and administrative rules and regulations related to biosecurity. Therefore, the first step in the planning process was to conduct a thorough review of the literature pertaining to Hawaii's biosecurity. In addition, information on the well-known and well-established biosecurity systems of New Zealand and Australia, as well as those of other island jurisdictions, such as that for Galapagos Islands, was reviewed. A summary of the compiled literature on Hawaii's biosecurity gaps and recommendations was developed to provide the foundation and framework for this HIBP.

Invasive species affect the entire community. Thus, one of HDOA's most critical considerations during the development of this HIBP was to ensure that the community engagement process was extensive, inclusive, and comprehensive. This process included the following events:

A public (government) sector workshop was organized to gather firsthand information about onthe-ground, procedural, regulatory, and funding challenges and opportunities from agencies such as
HDOA, DLNR, APHIS, and HDOT that regulate or are deeply involved in biosecurity issues in
Hawaii. The framework developed for this HIBP (and based on a summary of compiled literature on
Hawaii biosecurity) was used to solicit input from the agency representatives during a 1-day-long
professionally facilitated workshop.

During the planning process, a 1-day-long professionally facilitated workshop was held on April 14, 2016, to gather firsthand information from agencies and organizations involved in Hawaii's biosecurity. (Source: H. T. Harvey & Associates)

• Private industry workshops and teleconferences were organized to gather input from the private industry stakeholders, such as the farmers, ranchers, nursery growers, and freight forwarders who are likely to be directly affected by invasive species and biosecurity measures. The input gathered from

the public sector workshop was incorporated into the framework of the developing plan before input from the private industry stakeholders was solicited through two 2-day-long workshops organized in Honolulu and Hilo.

This draft HIBP incorporates input received from the public and private sector stakeholders. After a thorough review and approval from the lead agencies implementing this plan, followed by a review by pertinent legislators, and the governor's office, the draft HIBP will be released for public review in early September 2016. In October 2016, statewide public meetings will be organized to solicit input from the public. The final plan is scheduled to be released in November 2016.

2.4 Biosecurity Plan Approach, Structure, and Organization

To meet the biosecurity challenges facing the state and effectively address this complex problem, this HIBP is designed to be comprehensive in scope (e.g., preborder, border, postborder) and interagency in nature. The objectives and implementation tasks identified in this HIBP are consistent with the existing government agencies' and partner organizations' strategic plans to address invasive species issues. This HIBP is also structured to be consistent with the programs of the various county, state, and federal agencies responsible for providing biosecurity protection in the state and nation. However, the responsibility of implementing this HIBP lies with the state, primarily with HDOA and DLNR and to a lesser degree with DOH, UH, and the counties. It is organized to implement HDOA's and other state agencies' programs that focus on one or more of the following four program areas:

- Preborder (Pre)
- Border (Bor)
- Postborder (Pos)
- Public Awareness and Support (Pws)

The goals for each of these program areas serve as guideposts to manage new and existing biosecurity risks. Each strategic goal is associated with long-term objectives and shorter-term implementation tasks. Within each program area, the objectives and implementation task are grouped according to the type of action they involve:

- Policy Action (Pol)
- Process or Program Action (Pro)
- Technology, Infrastructure, Funding, or Staffing (Tifs)

Accordingly, the implementation tasks related to one issue sometimes are discussed separately depending on whether it is about policy, process, or resource (technology, infrastructure, funding, or staffing). For instance, to implement a new emanifesting system to collect information on incoming imports for screening and

inspection purposes (process action), will require a change in statutes and rules (policy action) to authorize HDOA to identify commodities to inspect, prescreen, and release electronically. This action will also require HDOA to secure funds for equipment and increase staffing (technology, infrastructure, funding and staffing action) to implement the emanifest system. Therefore, there are three implementation tasks regarding emanifest system: one policy related; one process related; and one related to technology, infrastructure, funding, and staffing. This HIBP identifies these separate types of actions needed under each program area (preborder, border, and postborder).

Objectives outline general ideas that contribute to achieving the goal over the medium and long term. Implementation tasks are specific actions that will need to be taken to achieve each objective. Implementation of tasks is expected to depend on the availability of time and funds, regulatory mandates, and the institutional support and commitment of the agencies involved. Each implementation task is associated with a timeline, lead agency, and partnering organization. This HIBP addresses both terrestrial and aquatic biosecurity issues, which are often addressed together under an overarching objective. Sometimes, they are addressed under a specific terrestrial or aquatic objective.

The goals, objectives, and implementation tasks discussed in this HIBP are presented as follows:

Goal (Preborder, Border, or Postborder)

This section is not meant to provide *general* information on preborder, border, postborder, or public awareness and support efforts in Hawaii. Rather, it provides specific background information, mostly from the state's perspective, that is necessary to put the HIBP objectives in each program area in context with the need or gaps identified during the planning process.

Policy-Related Objectives (PrePol, BorPol, PosPol, or PwsPol)

Objective (PrePol1, BorPol1, PosPol1 or PwsPol1)				
PrePol1/BorPol1/PosPol1/PwsPol1	Implementation Tasks	Timeline	Lead Agency	Partnering Organization
PrePol.1/BorPol1.1/PosPol1.1/PwsPol1.1				
PrePol1.2				

2.4.1 Timeline

This HIBP is designed to be implemented over a period of 10 fiscal years, from July 2017 through June 2027 (Fiscal Year 2018 [FY2018] through FY2027). Work on implementation tasks may start as soon as January 2017, as staff and resources are available. The timeline includes the proposed start and completion dates for each implementation task in calendar years, beginning with 2017 for tasks that can be started immediately. Many

tasks are envisioned to require new staffing or funding and are scheduled to be started at the beginning of a given fiscal year. The first fiscal year identified in the plan is FY2018 and is denoted as 2018 in the timeline.

2.4.2 Lead Agency

The "Lead Agency" column identifies which agency or organization is responsible for implementing, coordinating, and completing the task. Typically, a single entity is identified in this column. If two or more lead agencies are identified, these agencies will implement the same task simultaneously. Existing and/or new staff members budgeted for the lead agency are expected to implement that task. The lead agency is responsible for requesting the allocated funds for implementing a task from the legislature in its biennium budget.

2.4.3 Partnering Organization

The partnering organization identified in the last column can be another state or federal agency; UH; the county government; a private industry or landowner; or a quasi-government organization, such as CGAPS. Partnering organizations are expected to contribute to implementing that task with their existing staff and resources. Their contributions could include providing information, review of task products, approval of permits, access or use of their land, or support and advocacy during the legislative process.

Section 3.0 Goals, Objectives, and Implementation Tasks

3.1 Preborder

Goal: Prevent the Transport of Invasive Species to Hawaii

3.1.1 Background

Preventing invasive alien species from reaching Hawaii's borders is the most cost-effective strategy to manage threats from invasive species. The implementation tasks and objectives presented in this section are aligned to address the goal of preventing the entry of an invasive species into Hawaii.

Federal agencies like APHIS, CBP, USFWS, the U.S. Coast Guard (USCG), and CDC and the two state biosecurity agencies of HDOA and DLNR primarily regulate or enforce regulation relative to the entry of organisms into Hawaii. From a regulatory viewpoint, the federal government is responsible for preventing foreign plant and animal diseases and pests from entering the United States. In general, state agencies are responsible for regulating domestic commodities originating elsewhere in the United States. In Hawaii, HDOA's inspection authority extends only to agricultural and highrisk materials coming from the continental United States. HDOA inspects for a range of organisms and can take action on those that are prohibited, those that are restricted, and also those not known to occur in Hawaii. Under the Plant Protection Act (7 United States Code [USC] Section 7701 et seq.), states are expressly prevented from regulating foreign commerce to control, eradicate, or prevent the introduction or dissemination of plant pests or noxious weeds (7 USC Section 7756[a]). The Plant Protection Act also preempts states from regulating domestic commerce if the federal government has already issued such a regulation for those purposes, unless the regulation is consistent with but does not exceed the federal

Pests like red imported fire ant (Solenopsis invicta) can easily arrive in Hawaii via nonagricultural commodities, including packaging materials. However, HDOA does not have the authority to inspect nonagricultural commodities and will need to pursue legislative amendment to do so. (Source: HISC)

regulation (7 USC Section 7756[b]). As a result, HDOA is prevented from inspecting foreign commerce or taking any quarantine action on foreign commerce at ports of entry. In certain instances, federal law also bans HDOA inspection of some domestic cargo. Therefore, federal inspectors in Hawaii have a critical role to prevent pests of foreign origin from entering the state (HDOA 2007, Loope and Kraus 2009, Rago and Sugano 2015).

USDA can take action on organisms that pose a documented threat to U.S. agriculture, forestry, or environment and those that are on lists of federally regulated organisms, such as the Federal Noxious Weed List. However, species that may not pose a risk to the temperate crops and forests of the continental United States could pose a risk in Hawaii's year-round optimal climate. In fact, many organisms that are of greatest risk to Hawaii, such as little fire ant, myoporum (naio) thrips (*Klambothrips myopori*), and nettle caterpillar, are not among the federally regulated organisms. Hawaii has unique biosecurity needs (see Section 2.0, "Introduction"):

- Hawaii is extremely vulnerable to biological invasions (McGregor 1973, HDOA 2002).
- The spectrum of dominant endemic/native plant species in Hawaii differs from that found in the rest of the United States and provides habitat for the rest of Hawaii's biota, including many endangered species and a largely endemic (found nowhere else in the world) biota (DeNitto et al. 2015).
- Hawaii imports more than 80% of all its goods and approximately 90% of its food (HDOT 1997, Lueng and Loke 2008).

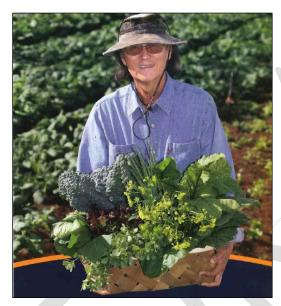

To prevent the entry of invasive species via foreign pathways, Hawaii needs to continue to emphasize its unique biosecurity needs and receive better federal protection. A thorough analysis of international, federal, and state policy gaps with recommendations to close such loopholes is warranted (PrePol3). There are relatively new programs that allow states to petition for federal action on a state concern. HDOA should leverage such programs and work with APHIS to develop quarantine regulations specific to Hawaii. Whenever APHIS announces draft regulations on potential quarantines for proposed imports to the United States, HDOA should provide a response with information that supports the need for specific restrictions on such importation to Hawaii. However, HDOA has few resources to put together and track petition packages, and the scope of the state Attorney General (AG) office's role is so broad that focused response and active involvement with APHIS's commenting processes can be a challenge. A policy analyst housed in HDOA could help fill this gap (PreTifs2).

As mentioned above, HDOA's inspection authority extends only to agricultural or high-risk materials coming from the continental United States. However, nonagricultural commodities and packaging material have been identified as important pathways for the entry of invasive species into Hawaii (DeNitto et al. 2015, USN 2015). Intercepting pests entering the state via these pathways would require legislative amendments that give HDOA the authority to inspect and quarantine high-risk nonagricultural commodities (PrePol2).

Preventing pests from entering Hawaii will require not only more comprehensive and cohesive authorities but also available technology and processes to improve efficiency. More than 80% of all goods used in Hawaii are imported (HDOA 2007). Inspecting all imports is impossible, but risk assessment would allow HDOA to determine which commodities and pathways pose a higher risk for the entry of pests (PreProl, PreTifs2). The HDOA PQ Branch maintains a database called INVICTA to record inspection, permitting, and pest reporting activities. This type of database is an essential tool for storing information and is used extensively to determine the effectiveness of operations and analyze the risks associated with pathways and commodities (HDOA 2015).

However, this database lacks the ability to perform other important HDOA functions, such as house important taxonomic data and communicate with other databases. An important feature of emanifest was integrated into this database system but was not fully implemented because of the associated costs.

Implementing an emanifest system would allow importers to send relevant information about the shipment (e.g., what is being shipped, where the shipment originated) to HDOA before the commodities arrive. This system will allow HDOA to schedule inspections based on the risk of the arriving commodities; release low-risk commodities electronically, thereby allowing for more efficient use of the limited workforce; and in general help prevent the arrival of unwanted organisms in Hawaii. HDOA is in critical need of a regulatory framework, processes, and technology to launch a sophisticated biosecurity database that can support an emanifest system, allow for efficient data gathering and sharing, and facilitate risk assessments and a full-time staff member to support this key component for biosecurity (PrePol 2, PrePro1, PreTifs1, PreTifs2).

Boosting the production of locally grown food is a key biosecurity strategy to reduce dependence on imported produce and therefore minimize the risk of pests entering Hawaii via this pathway. (Source: HDOA)

Invasive species that are affecting Hawaii forestry and agriculture, such as little fire ant, nettle caterpillar, ohia rust, and the fungus strain causing Rapid Ohia Death, likely arrived via plants. The import of plants for landscaping, sale or propagation, cut flowers, and foliage is considered a high-risk pathway for pests (Loope and Uchida 2012, DeNitto et al. 2015). HDOA is dedicated to enhance Hawaii's economy by promoting local agriculture, aquaculture, and landscape industries and by minimizing the impacts of invasive species. Key strategies identified during the planning process to protect these industries include requiring agreements for imported high-risk plant products to have phytosanitary certificates (PrePol2), reducing the importation of plant and animal species that are already available in Hawaii and boosting their local propagation or production, and substituting the importation of invasive plant and animal species with local production of noninvasive alternatives (PrePro2, PreTifs2).

Another important strategy to prevent pests from entering Hawaii is to move the greatest incursion risks as far offshore as possible and require, where possible, offshore inspection, treatment (with certification), or other actions. APHIS does this by collaborating with foreign partners to control pests and diseases before they can enter the transport system. For example, APHIS Wildlife Services in Guam takes numerous measures, such trapping and using trained snake-detector dogs in cargo, to keep brown tree snakes from reaching Hawaii and other destinations. Hawaii has also taken this approach when screening Christmas trees. Before they are shipped to Hawaii, Christmas trees and wreaths are inspected and reconditioned (mostly through mechanical shaking) in Oregon by the Oregon Department of Agriculture (HDOA 2015). This approach has significantly reduced

the number of pests that arrive through this pathway. More goods being exported to Hawaii can be inspected offshore at transitional facilities owned and operated by private industries that meet Hawaii-specific standards for the building structure, as well as for screening protocols (PrePol2, PrePro1, PrePro4).

The illegal importation of regulated plants and animals remains an important pathway for pests entering Hawaii (HISC 2014, Rago and Sugano 2015, USN 2015). For example, seeds of plants that are restricted or prohibited in Hawaii can be purchased online and shipped here, without properly labeling the parcel or presenting the material to HDOA for inspection. Gathering information and working with online plant nurseries and pet stores so they understand Hawaii's biosecurity needs would reduce the illegal importation of plants and animals and their associated pests into Hawaii (PrePro3).

The U.S. Department of Defense (DOD) is a large stakeholder in Hawaii's biosecurity. The five armed forces of DOD are represented in a total of 19 military bases and compounds in Hawaii. Driven mostly by existing federal laws, such as the Endangered Species Act (ESA), DOD has some protocols and processes in place to help prevent the entry of pests into Hawaii. For example, DOD, through Section 7 consultations, works closely with USFWS and USDA Wildlife Services and follows strict protocols when transporting equipment from Guam to Hawaii to prevent the introduction of brown tree snakes, which are prevalent on Guam. However, in general, Hawaii does not have the authority to inspect or quarantine commodities transported by DOD from foreign ports to the islands. DOD is also exempt from the state's ballast water rules. Therefore, the state needs to enhance its partnership with DOD and federal quarantine and regulatory agencies through formal mechanisms, such as existing laws and Memoranda of Understanding (MOUs), to adopt stricter biosecurity measures that would provide increased protection to Hawaii (PrePol1, PrePro3).

Hawaii's role in safeguarding livestock and poultry industries against animal diseases of high concern is important because it affects the ability of the United States to trade agriculture products on the global market. HDOA's AI Division issues import permits and enforces prearrival requirements to ensure that newly imported animals have been properly identified, examined, and tested for disease before transport. The AI Division identified a need for more efficient use of technology and better coordination with federal and international partners to identify and screen for high-impact animal diseases. In particular, there is the need to align the

Ballast water is a high-risk pathway for the entry of Aquatic Invasive Species into Hawaii. Current regulations regarding exchange of ballast water and processes to report and document it do not provide adequate biosecurity protection for Hawaii. (Source: CGAPS)

list of notifiable diseases with internationally and nationally recognized lists of existing threats to domestic livestock, identify new threats and ensure that adequate biosecurity measures are taken, and fund equipment and licensing that will better record the movement of livestock animals to maintain database on arriving animals and align with federal data (PrePol3, PrePro1, PreTifs1).

With regard to aquatic organisms, USCG, the U.S. Environmental Protection Agency (EPA), DAR, and DOH share regulatory authority to prevent the entry of AIS via ballast water. In this case, unlike under the Plant Protection Act, the state has greater freedom to regulate. It can regulate ballast water discharged in state waters irrespective of whether the vessel originates from a foreign or domestic (U.S. mainland) port, with some exceptions, such as DOD vessels. However, there is insufficient coordination with national and international port authorities, the DOD, and shipping companies to ensure that ballast water procedures are being implemented consistently (DLNR 2003, Davidson et al. 2014, USN 2015) (PrePol1). Furthermore, current regulation regarding the exchange of ballast water and reporting/documenting systems does not provide adequate protection and needs to be updated to, at a minimum, meet more protective USCG national standards (PrePol1). Unlike ballast water, the USCG does not regulate and the state does not have the authority to regulate hull biofouling as an invasive species risk; this issue is addressed in Section 3.2, "Border."

Specific objectives and implementation tasks related to policy, process, and infrastructure and funding resources needed to enhance preborder security in Hawaii are listed below.

3.1.2 Policy-Related Objectives and Implementation Tasks for Preborder

Objective—PrePol1. Enact or Reform Policies Governing Importation of Commodities or Introduction of Organisms to Provide Additional Protection for Hawaii				
PrePol1	Implementation Tasks	Timeline	Lead Agency	Partnering Organization
PrePol1.1	Propose for enactment the necessary legislative amendments to HRS §150A-5 (and other related sections) to enable HDOA to screen and inspect nonagricultural commodities and amend or promulgate corresponding administrative rules, as needed.	2017–2019	HDOA	AG HDOT
PrePol1.2	Propose for enactment the necessary legislative amendments (e.g., an amendment to the list of commodities regulated by statute, as proposed in Prepol2.1), and promulgate administrative rules in accordance with HRS §§ 150A-9 and -53 to implement a comprehensive emanifest system. Examples include redefine "inspect" to include electronic release, authorize HDOA to prescreen and release commodities electronically, and require manifests to indicate whether the goods are of foreign or domestic origin and the port of origin.	2017–2019	HDOA	AG
PrePol1.3	Amend HAR Chapter 4-70 to enable HDOA to require importers to treat/fumigate commodities identified by HDOA as a high biosecurity risk. Use fumigation of coffee imports as a successful model system.	2020–2021	HDOA	AG

	Objective—PrePol1. Enact or Reform Policies Governing Importation of Commodities or Introduction of Organisms to Provide Additional Protection for Hawaii				
PrePol1	Implementation Tasks	Timeline	Lead Agency	Partnering Organization	
PrePol1.4	Require declaration of high-risk packaging materials in shipments to Hawaii regardless of commodity.	2022–2023	HDOA	HDOT	
PrePol1.5	Amend HAR Chapter 4-70 to update quarantine requirements for tissue-cultured plants. Certified tissue-cultured plants indexed for targeted pests and pathogens by a qualified lab independent of the exporter and imported in sealed vials and in sterile media should not be quarantined as long as these plants are of species, subspecies, variety, or type that can otherwise be permitted for importation.	2020–2021	HDOA	UH	
PrePol1.6	Amend HAR Chapter 13-76 to make it consistent with USCG ballast water regulations . For example, develop and implement minimum ballast water discharge standards for organisms and certain indicator microorganisms.	2018–2019	DLNR	HDOT USCG	
PrePol1.7	Obtain an MOU between the Office of the Governor of Hawaii and the DOD to require that military vessels (including those participating in Rim of the Pacific Exercise) entering Hawaii meet state standards regarding ballast water treatment and hull cleaning.	2020–2021	DLNR	DOD	
PrePol1.8	Submit petitions to HDOA to either add unlisted high-risk AIS organisms to the list of prohibited species or change list placement (e.g., from conditionally approved to restricted or prohibited list to allow for more stringent regulation.	2022–2023	DLNR	AG HDOT	

Objective—PrePol2. Develop Regulatory Framework for Offshore (Preborder) Screening and Certification of Commodities				
PrePol2	Implementation Tasks	Timeline	Lead Agency	Partnering Organization
PrePol2.1	Enter into cooperative agreements with other state departments of agriculture or with private industries to establish offshore screening programs (similar to HDOA's current Christmas tree screening program in Oregon) for high-risk commodities being shipped to Hawaii.	2020–2021	HDOA	AG HDOT
PrePol2.2	Amend HRS Chapter 4-70 to require phytosanitary certificates for high-risk plant materials imported from domestic sources, and identify needed federal actions or enter into cooperative agreements to obtain phytosanitary certificates for imports of high-risk plant materials from foreign sources (also see PrePol1.1).	2020–2021	HDOA	AG APHIS

	Objective—PrePol3. Address International, Federal, and State Policy Gaps in Prevention to Reflect Hawaii's Unique Biosecurity Challenges Relative to Geography and Climate				
PrePol3	Implementation Tasks	Timeline	Lead Agency	Partnering Organization	
PrePol3.1	Complete an analysis of international and federal laws and regulations that currently preclude the state from taking effective action to prevent the introduction of invasive species to Hawaii, and list amendments and recommendations to better protect Hawaii (also see PreTifs2.1).	2018–2019	HDOA	AG DOH HISC DLNR (for aquatics) HDOT APHIS USFWS CBP DOD	
PrePol3.2	Consult with the California and Florida Departments of Agriculture regarding what state and federal laws, regulations, and policies have been enacted to give them special protection at the state level, and produce recommendations to enact comparable protection for Hawaii.	2017–2019	HDOA	AG CDFA FDACS	
PrePol3.3	Align the notifiable disease list with internationally and nationally recognized lists of existing threats to domestic livestock (terrestrial and aquatic).	2017–2020	HDOA	USDA OIE	

3.1.3 Process-Related Objectives and Implementation Tasks for Preborder

Objective—PrePro1. Improve Systems to Collect and Share Data and Conduct Regular Risk Assessments to Identify Pests, Diseases, Commodities, and Pathways of High Risk to Hawaii				
PrePro1	Implementation Tasks	Timeline	Lead Agency	Partnering Organization
PrePro1.1	Implement a comprehensive emanifest system that is effective no later than January 1, 2020. The system must be able to collect relevant nonproprietary information, authorize HDOA to prescreen and release commodities electronically, require manifests to indicate whether the goods are of foreign or domestic origin, identify port of origin, and be implementable on a trial basis between 2017 and 2019 to identify the need for any improvements. (Also see PrePol1.2)	2017–2020	HDOA	HDOT
PrePro1.2	Conduct risk analyses of terrestrial pests, diseases, commodities, and pathways to prioritize screening and inspections.	2018–2027	HDOA	APHIS UH DLNR
PrePro1.3	Conduct risk assessments for hull fouling, ballast water, aquaculture, and aquarium issues to better inform regulation of AIS organisms being introduced via these pathways and affecting native habitats.	2018–2027	DNLR	HDOA APHIS USFWS Industry

	Objective—PrePro1. Improve Systems to Collect and Share Data and Conduct Regular Risk Assessments to Identify Pests, Diseases, Commodities, and Pathways of High Risk to Hawaii				
PrePro1	Implementation Tasks	Timeline	Lead Agency	Partnering Organization	
PrePro1.4	Based on the results of the risk analyses, annually write/update import requirements for high-risk commodities imported to Hawaii.	2018–2027	HDOA	APHIS UH DLNR	
PrePro1.5	Implement a state-of-the-art biosecurity database system within HDOA to meet important functions, such as emanifest, efficient input from risk assessments, capability to house survey and taxonomic data, ability to communicate among different databases, and ability to produce query-specific reports.	2017–2020	HDOA	DLNR	
PrePro1.6	Obtain MOUs for sharing data between state and federal agencies and the industry that facilitate sharing relevant biosecurity information and also ensure proper handling of proprietary or confidential information.	2017–2018	HDOA	APHIS DLNR Industry	
PrePro1.7	Conduct an annual policy review of animal disease import regulations to identify new threats and ensure that adequate biosecurity measures are taken.	2017–2027	HDOA	APHIS	

	Objective—PrePro2. Support Agriculture, Aquaculture, and Landscape Industries in a Way That Protects Hawaii from Pests				
PrePro2	Implementation Tasks	Timeline	Lead Agency	Partnering Organization	
PrePro2.1	When entering into compliance and trade agreements in domestic and foreign markets, incorporate measures via MOUs that safeguard Hawaii's unique biosecurity needs in addition to the market opportunities in the islands.	2020–2027	HDOA	APHIS FAS	
PrePro2.2	Create working groups with representatives and end users of the aquaculture, wetland agriculture, and aquarium industries to work directly with agency staff to identify high-risk pathways and standards for facilities and institute self-policing practices to minimize AIS threats.	2017–2027	DLNR	HDOA Industry UH	
PrePro2.3	Create working groups with representatives of the food, forestry, livestock, biofuel, and landscape industries to work with HDOA's import substitution program (also see PreTifs2.4), DLNR, and UH staff to substitute importation of plants (already in Hawaii) that pose a high-risk pathway for the introduction of pests and pathogens with plants that can be grown locally. Reduce importation with local production by 2027.	2017–2027	HDOA DLNR	UH	

Objective-	Objective—PrePro3. Reduce the Accidental and Illegal Introduction of Invasive Species				
PrePro3	Implementation Tasks	Timeline	Lead Agency	Partnering Organization	
PrePro3.1	Enter cooperative agreements with ecommerce industries (e.g., online plant nurseries, pet stores) to include language on their websites about what is not allowed to be imported or shipped to Hawaii, and compel them to follow existing import regulations.	2020–2021	HDOA	AG DLNR Industry	
PrePro3.2	Enter MOUs with DOD to cooperate in an annual review to identify and close gaps in policy, process, and procedures to prevent inadvertent introduction of invasive species via household goods, equipment and other materials transported by DOD's units and contractors.	2018–2027	HDOA	DOD DLNR	
PrePro3.3	In collaboration with other state and federal regulatory agencies, establish an intelligence unit with the purpose of identifying and preventing illegal introductions (including ecommerce) to Hawaii.	2017–2027	HDOA	DLNR AG APHIS CBP USFWS USCG	

_	Objective—PrePro4. Establish Processes and Protocols for Offshore (Preborder) Screening and Certification of Goods and Manifests				
PrePro4	Implementation Tasks	Timeline	Lead Agency	Partnering Organization	
PrePro4.1	Write Hawaii-specific standards and protocols for use in compliance agreements for offshore prescreening of agricultural and nonagricultural commodities en route to Hawaii.	2020–2021	HDOA	APHIS Industry	
PrePro4.2	Enter into cooperative agreements or contracts with private industry to conduct inspections at transitional facilities at offshore sites for high-risk import commodities.	2022–2027	HDOA	AG APHIS Industry	

3.1.4 Technology, Infrastructure, Funding, and Staffing-Related Objectives and Implementation Tasks for Preborder

Objective—PreTifs1. Develop New and Improve Existing Infrastructure and Technology to Support Preborder Biosecurity for Hawaii				
PreTifs1	Implementation Tasks	Timeline	Lead Agency	Partnering Organization
PreTifs1.1	Fund equipment and licensing to support the emanifest system.	2019–2027	HDOA	HDOT
PreTifs1.2	Fund equipment and licensing to support HDOA's biosecurity database system.	2019–2027	HDOA	DLNR
PreTifs1.3	Fund equipment and licensing that will record the movement of livestock animals and hold prearrival testing results. The data are aligned with existing	2019–2027	HDOA	APHIS

Objective—PreTifs1. Develop New and Improve Existing Infrastructure and Technology to Support Preborder Biosecurity for Hawaii				
PreTifs1	Implementation Tasks	Timeline	Lead Agency	Partnering Organization
	federal databases to track movement and animal identification for disease trace-back.			

Objective-	Objective—PreTifs2. Enhance Funding and Staffing Support for Preborder Biosecurity Operations				
PreTifs2	Implementation Tasks	Timeline	Lead Agency	Partnering Organization	
PreTifs2.1	Hire two policy analysts to conduct international, federal, and state policy analysis and write necessary rules and regulations listed in this plan.	2018–2027	HDOA	DLNR DOH	
PreTifs2.2	Hire three entomologists, two plant pathologists, and one botanist at HDOA to conduct risk analysis on pathways and on organisms and commodities entering Hawaii.	2020–2027	HDOA	DLNR UH	
PreTifs2.3	Hire four data management specialists to support HDOA's new biosecurity database system.	2020–2027	HDOA	DLNR	
PreTifs2.4	Fund an annual import substitution program to encourage Hawaii growers to identify and grow food and nonfood alternative products to phase out imports of high-risk pathway food/commodities by 2027.	2018–2027	HDOA	UH Industry	

3.2 Border

Goal: Enhance the Detection and Control of Pests and Diseases at Ports of Entry

3.2.1 Background

Effective surveillance, detection, and treatment of pests at the border depend on a robust regulatory framework that authorizes state and federal agricultural inspectors to take action on species that reach our borders, processes that allow for efficient execution of biosecurity measures, and infrastructure and technology to support implementation of border security processes.

The same agencies engaged in preborder security also have a mandate to ensure the inspection for pests and treatment of invasive species that reach Hawaii's borders. HDOA, APHIS, CBP, and USFWS are among the key regulatory agencies that screen incoming people and products at our borders. Hawaii has 16 ports and harbors, and Honolulu Harbor and Honolulu International Airport receive the vast majority (more than 90%) of passengers, cargo, and conveyances arriving from both domestic and foreign sources. HDOA and USDA agricultural inspectors prevent the introduction of harmful pests and diseases from domestic (other U.S. states) and foreign sources, respectively. This work is conducted primarily through various programs, including permit

reviews, air and sea ports-of-entry inspections and quarantine, interisland inspections (covered in Section 3.3, "Postborder"), and investigation and enforcement of state and federal quarantine laws and regulations.

Screening for pests at the border primarily involves visual inspection of agricultural items (including plants, plant parts, nondomestic animals, microorganism cultures, microbial products, arthropods, and soil). HDOA maintains lists of taxa that are conditionally approved for importation, restricted, or prohibited from importation. For example, all unlisted nondomestic animals are considered prohibited from entry, but there is no list of prohibited microorganisms, so they can only be imported after review and approval by the agriculture board. However, these lists do not include important plants, animals, and microorganisms recognized to be harmful to Hawaii. For example, the state's noxious weed list primarily includes weeds of agriculture and temperate climates, many of which are already widespread in Hawaii. Therefore, to enhance biosecurity, lists of state-regulated organisms must be updated periodically to include organisms (based on the results of plant or pest risk assessments, see Section 3.1, "Preborder") that are harmful to Hawaii's agriculture, its natural environment, and the health and lifestyle of its people (BorPol2).

Honolulu International Airport and Honolulu Harbor receive the vast majority of commodities shipped to Hawaii. At these border ports, HDOA is our first line of defense against invasive species entering Hawaii. (Source: HDOA)

At the federal level, the mandate of the agencies is to protect the United States from the impacts of harmful species. However, as discussed above, Hawaii has unique biosecurity needs compared to the other 49 states (see Section 2.0, "Introduction," and Section 3.1, "Preborder"). Therefore, the federal lists of pests to report and take action on do not always include pests that are specifically harmful to Hawaii, and the related regulations also do not always address these harmful pests. State and federal inspectors in Hawaii coordinate to detect invasive species of state importance entering via foreign pathways. However, it is in the state's best interest to coordinate and harmonize pest lists and actions whenever possible and to share information on interceptions and species of concern through formal (e.g., policy change, see Section 3.1, "Preborder") and informal (e.g., meetings, workshops, see BorPol1, BorPro1) mechanisms to ensure that Hawaii is protected from harmful pests entering from foreign sources.

In general, imported agricultural commodities are inspected where they first arrive: in cargo areas of importers, in temporary spaces, or even on the dock piers or airport tarmacs. Given this current situation, combined with the increasingly high volume of cargo shipped to Hawaii and concern for food safety, there is an urgent need to plan and secure appropriate inspection facilities. This need is likely to be magnified further if HDOA is authorized to also inspect high-risk nonagricultural commodities. During the planning process, two types of

facilities were proposed to address this growing need for space to conduct border inspections: (1) transitional facilities owned and operated by private industry (e.g., produce distributor) and (2) inspection facilities operated by the state, with preference given to new facilities located off site of congested ports and harbors. However, a change in statute is needed to require importers to transport commodities that are high risk to such off-port state-designated inspection facilities.

Imported produce often awaits inspection outdoors at the ports (left). To meet the growing volume of imported goods, HDOA urgently needs enclosed, well-lit, and temperature-controlled facilities (right) to conduct inspections efficiently and enhance border protection. (Source: HDOA)

In 2009, HDOA implemented a pilot program whereby inspections for some agricultural commodities are conducted at a transitional facility in Honolulu. Because the unloading and inspections are performed in an airconditioned area and the facility is secured, this approach reduces the chance for pests to escape and maintains food quality during the inspection process. The importers also benefit because perishable goods are transported immediately to these secure and temperature-controlled facilities for inspection. Having additional transitional inspection facilities, especially near major ports and harbors statewide, would greatly facilitate increased inspections and enhance border security for Hawaii (BorTifs2). Current HDOA regulations allow for inspection at such transitional inspection facilities; however, formulating well-defined regulations and developing building and operating standards so that these facilities meet HDOA's biosecurity standards would better meet the industry demand for such facilities and would strengthen border security (BorPol1, BorProl1).

Although based on the results of the pilot program, transitional facilities have proved to work well for agricultural items, HDOA anticipates needing more space for screening high-risk nonagricultural commodities. Furthermore, HDOA does not have the authority to require shippers or importers to transport goods for inspection to a facility located outside of a port or harbor. HDOA therefore needs to pursue an amendment to existing regulation that will authorize it to require the transport of high-risk commodities to off-site inspection facilities (BorPol1). However, in the interim, HDOA needs to work with HDOT and the private sector to use available space at the ports and harbors to meet the growing needs for inspection.

Pest interception reports indicate that cargo inspections yield more interceptions when additional staff members participate (BorTifs1). This participation includes the use of dogs (with handlers) trained to detect agricultural materials in places not otherwise visible to the inspectors (e.g., passenger bags) (BorTifs2). With adequate staffing, cargo inspection plays a major role in mitigating pest introduction and therefore is a high priority when resources are allocated. Additional resources, such as Xray machines for surveillance and autoclaves and freezers for destroying harmful pests, contribute to make border security processes more efficient (BorTifs2).

The brown tree snake (Boiga irregularis) remains a constant threat to Hawaii. (Source: CGAPS)

A risk assessment study at the Kahului airport reported to have detected on average, one organism per day that was not known to occur in Hawaii and could potentially be a pest (HDOA 2002). Invasive species not known to occur in Hawaii, such as the brown tree snake, and predicted to cause huge economic and ecological damage, have been intercepted multiple times at the borders. These interceptions highlight the need for continuous monitoring in and around ports of entry to capture pests that infiltrated the borders (BorPro1). In addition, there are numerous examples where a lack of dedicated funding or immediate, coordinated efforts for detection and eradication allowed newly

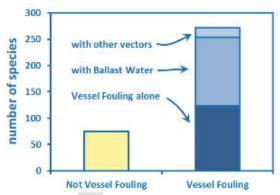

detected pests (in the vicinity of borders or beyond) (e.g., banana bunchy top virus, coffee berry borer [Hypothenemus hampei], little fire ant) to become established, leaving no other option than expensive and perpetual containment or control. Hawaii needs to establish an interagency biosecurity emergency task force with dedicated funding to enhance its capacity to take timely action to eradicate new pest incursions (BorPol1, BorPro3).

Movement of domestic animal species is a recognized pathway whereby diseases and exotic parasites of high concern may enter the state. Current border activities that guard against entry of animal disease include inspection by AI staff to examine animals for clinical signs of illness and presence of foreign parasites; verify permits, shipping documents, and tracking devices; and enforce import and handling requirements. However, livestock disease monitoring services (staff and infrastructure) are limited to only some ports and need to be expanded (BorPro1, BorTifs1, BorTifs2). Policy changes to effectively enforce penalties for violating animal import requirements also would facilitate better border protection (BorPo1).

Ballast water (addressed in Section 3.1) and hull biofouling are two important pathways for the entry of AIS into the state. There currently are no state rules in place for DAR to regulate inspection of vessels (for invasive species that may be attached to the hull) that enter state waters (PrePol1). USCG does not regulate biofouling; therefore, DAR's authority to manage this risk is very important. Developing standard operating procedures

for collecting and reporting data, implementing best management practices for hull cleaning, testing and applying new techniques for treating ballast water and hull biofouling are just a few strategies identified in this HIBP to minimize the spread of AIS that cross our border (BorPro2). Staffing must be increased, and a data management system must be implemented (BorTifs3) to support a comprehensive program to manage biosecurity threats related to ballast water and hull biofouling.

Specific objectives and implementation tasks related to policy, process, and infrastructure and funding resources needed to enhance border security in Hawaii are listed below.

Vessel biofouling has contributed between 35% and 78% of Hawaii's introduced and cryptogenic species (n=346). It is ranked highest among all vectors of initial introduction to Hawaii, but there are no regulations that authorize the state to inspect vessels. (Source: Davidson et al. 2014)

3.2.2 Policy-Related Objectives and Implementation Tasks for Border

Objective—BorPol1. Address Gaps in Federal and State Policies and Enact Regulations to Improve Border Protection for Hawaii				
BorPol1	Implementation Tasks	Timeline	Lead Agency	Partnering Organization
BorPol1.1	Propose for enactment appropriate legislation (through HRS Chapter 150A) to enable HDOA oversight and establishment of transitional facilities in Hawaii for freight inspection and quarantine.	2017–2019	HDOA	AG
BorPol1.2	Propose for enactment appropriate legislation (through HRS Chapter 150A) to enable HDOA to require the importer to transport shipped commodities that HDOA determines to be of high risk to state-designated inspection facilities.	2017–2019	HDOA	AG
BorPol1.3	Collaborate with CBP, APHIS, CDC, and HDOA to review agency authorities, policies, and procedures and write a plan to take preventive action when disease-carrying vectors not on the APHIS actionable list (e.g., mosquitoes) are found in foreign cargo or conveyances (unintentional import).	2017–2019	DOH	APHIS CBP CDC HDOA
BorPol1.4	Propose for enactment the necessary legislation to authorize DLNR to inspect vessels and regulate hull-fouling threats.	2018–2019	DLNR	HDOT
BorPol1.5	Propose for enactment necessary legislation (through HRS Chapter 141 or 150A) to create a biosecurity emergency response fund to support multiagency terrestrial and aquatic emergency responses at or beyond (postborder) ports by emergency task forces (see also BorPro3.1).	2018–2019	HDOA	DOH HDOT DLNR

Protection for Hawaii				
BorPol1	Implementation Tasks	Timeline	Lead Agency	Partnering Organization
BorPol1.6	Propose for enactment legislation to move enforcement of HDOA's importation statutes and regulations under the Hawaii Environmental Court by amending HRS § 604A-2 to include civil fines for violations of HRS Chapter 150A within the Environmental Court's jurisdiction.	2022–2023	HDOA	AG
BorPol1.7	Amend the current penalty section in HRS §142-12, relating to violations of Al Division Quarantine Rules, to authorize issuance of administrative citations for minor violations such as failure to file written or verbal reports in prescribed time, or failure to provide nonconsequential information on shipping and import forms.	2018–2020	HDOA	AG

Objective-	BorPol2. Update State-Regulated-Pest Lists to Provide	More Protecti	on to Hawai	i
BorPol2	Implementation Tasks	Timeline	Lead Agency	Partnering Organization
BorPol2.1	Amend HRS 141-3 to provide HDOA the flexibility to not have to cover the costs associated with the control of noxious weeds and update the state's noxious weed list and noxious weed seed list as outlined and/or required in HAR Chapter 4-68 and HAR Chapter 4-67, respectively, to include invasive plant species harmful to Hawaii's agriculture and natural systems.	2018–2019	HDOA	AG
BorPol2.2	Promulgate administrative rules, as required under HRS § 150A-6.1, to add species to the restricted plant list, and regulate or prohibit the introduction, sale, distribution, and propagation of specific plants put on the restricted plant list.	2018–2019	HDOA	DLNR AG
BorPol2.3	Update HAR Chapter 4-71A, Plant and Non-Domestic Animal Quarantine Plant Import Rules, to include microorganisms and plant pathogen species and taxonomic levels below species (e.g., subspecies and strains) that are of high risk to Hawaii's agriculture/horticulture/ forests and animal/human health/safety. For example, include chikungunya and Zika viruses and the list of pathogens identified by the USFS study (DeNitto et al. 2015) on the list.	2018–2019	HDOA	DLNR USFS AG UH
BorPol2.4	Update HAR Chapter 4-70, Plant and Non-Domestic Animal Quarantine Plant Import Rules, to include host plant species of insects and pathogens, including those at taxonomic levels below species (e.g., subspecies and strains) that are of high risk to Hawaii's agriculture/horticulture/ forests and animal/human health/safety. Include the list of nonnative host plants of high-risk pathogens	2018–2019	HDOA	DLNR USFS AG

Objective—BorPol2. Update State-Regulated-Pest Lists to Provide More Protection to Hawaii				
BorPol2	Implementation Tasks	Timeline	Lead Agency	Partnering Organization
	identified by the USFS study (DeNitto et al. 2015) to the list.			
BorPol2.5	Update HAR Chapter 13-124 to add aquatic species to the state's injurious wildlife list.	2020–2021	DLNR	HDOA AG USFWS NOAA DOFAW

3.2.3 Process-Related Objectives and Implementation Tasks for Border

Objective- Borders	Objective—BorPro1. Enhance Invasive Species Surveillance, Detection, and Treatment Processes at the Borders				
BorPro1	Implementation Tasks	Timeline	Lead Agency	Partnering Organization	
BorPro1.1	Implement inspections by state detector dogs to intercept high-risk species difficult to detect by other methods of inspection or at ports of entry difficult to inspect with other methods (see also BorTifs1.3).	2018–2027	HDOA	APHIS CBP DLNR	
BorPro1.2	Write a set of minimum standards, specifications, and operational protocols that would constitute HDOA's certification program for operating transitional facilities in Hawaii. For example, secure facilities with appropriate mechanisms, such as fences, double doors, and negative pressure, to contain any pests encountered; appropriate processes executed when pests are found; and appropriate equipment based on the type of goods being inspected, such as air conditioning and refrigerators for perishable goods.	2018–2019	HDOA	Industry APHIS AG UH	
BorPro1.3	Enter into public-private partnership (e.g., contracts, cooperative agreements) to operate transitional facilities for freight and commodity inspections in Hawaii under HDOA's transitional facility certification program (see also BorPro1.2).	2018–2027	HDOA	AG Industry	
BorPro1.4	Hold quarterly coordinating meetings/ workshops with APHIS, CBP, DHS, USFWS, and DOH to facilitate communication relative to border processes, such as inspection and detection.	2017–2027	HDOA	APHIS CBP DHS USFWS DOH HDOT	
BorPro1.5	Provide annual training for state and federal inspectors on identification of emerging pests and diseases, as well as on new detection and screening methods for pests and disease.	2018–2027	HDOA	APHIS CBP DHS DOH DLNR UH	

Objective- Borders	Objective—BorPro1. Enhance Invasive Species Surveillance, Detection, and Treatment Processes at the Borders				
BorPro1	Implementation Tasks	Timeline	Lead Agency	Partnering Organization	
BorPro1.6	Based on the results of pathway and species risk assessments, run monitoring programs at major ports and harbors (ports and harbors that receive both domestic and foreign cargo) for high-risk pests not known to occur in Hawaii (e.g., brown tree snake) (see also BorTifs2.8).	2018–2027	HDOA	DLNR HDOT DOH	
BorPro1.7	Administer the livestock disease detection monitoring program focused on contagious animal diseases of high consequence and exotic parasites (and increase staffing and operations to include new port locations; see BorTifs1.3).	2018–2027	HDOA	APHIS	

Objective- Threats	Objective—BorPro2. Improve Inspection and Treatment Processes for Ballast Water and Hull Biofouling Threats				
BorPro2	Implementation Tasks	Timeline	Lead Agency	Partnering Organization	
BorPro2.1	Create ballast water reporting forms, and write protocols and processes to regulate ballast water management and treatment specific for Hawaii.	2018–2019	DLNR	DOH EPA USCG	
BorPro2.2	Create a form to report hull inspection, and write protocols for standard operating procedures for hull biofouling treatment applicable to Hawaii (see also BorPol1.3).	2018–2019	DLNR	DOH HDOT EPA USCG	
BorPro2.3	Create a database to house data collected for ballast water reporting and management and hull inspections and hull biofouling treatment. The database should also be able to generate reports that can be used to conduct risk analysis regarding ballast water and hull biofouling (see also PrePro1.3).	2018–2019	DLNR	HDOA HDOT USCG EPA	
BorPro2.4	Test and apply new technologies for ballast water and hull biofouling treatment, including in-water cleaning and treatment methods relative to their application in Hawaii.	2022–2023	DLNR	HDOA HDOT DOH USCG EPA	
BorPro2.5	Write best hull husbandry practices and proactive hull cleaning standards for all nonmilitary vessels to minimize movement of AIS into Hawaii's ports, harbors, and marinas.	2018–2019	DLNR	DOH HDOT EPA USCG	
BorPro2.6	Before regulations for ballast and hull biofouling inspection and treatment are enacted, enter into MOUs or cooperative agreements with partner agencies and port authorities to implement effective AIS prevention, inspection, and response best management practices.	2017–2019	DLNR	DOH HDOT EPA USCG	

BorPro3	Implementation Tasks	Timeline	Lead Agency	Partnering Organization
BorPro3.1	Create a multiagency Biosecurity Emergency Response Task Force to coordinate and respond to new aquatic and terrestrial pests or disease incursions both at and beyond (postborder) ports of entry. This task force should comprise representatives from relevant government agencies and consult with private industries working at the borders (e.g., airlines, shippers, freight forwarders).	2017–2027	HDOA DLNR	DOH HISC HDOT HI-EMA APHIS CBP USCG USFWS NPS DOD USCG NOAA EPA
BorPro3.2	Hold postincident meetings/workshops hosted by HDOA of the Biosecurity Emergency Response Task Force to coordinate/review/debrief rapid response actions, and set up an incident command system.	2017–2027	HDOA	DLNR HISC DOH HDOT HI-EMA APHIS CBP USCG USFWS NPS DOD Industry
BorPro3.3	Write species-specific response plans for high- risk/priority pests that detail the roles of relevant agencies and stakeholders. Review plans annually to ensure alignment with existing policies and USDA response plans.	2020–2023	HDOA DLNR DOH	APHIS HISC UH USFWS NPS
BorPro3.4	Write general and taxa-specific (e.g., insects, plants, fish), rapid-response strategies that can be implemented immediately in response to an emergency involving multiple agencies and private industries.	2020–2023	HDOA DLNR DOH	APHIS HISC UH USFWS NPS
BorPro3.5	Write contingency plans for treating and disposing of dirty ballast water and for cleaning biofouling vessels. Also include plan to dispose of harmful paint removed during the treatment.	2018–2019	DLNR	DOH HDOT USCG EPA NOAA
BorPro3.6	Write plans to respond to livestock diseases or exotic parasites. Review plans annually to ensure alignment with existing policies and USDA response plans.	2017–2027	HDOA	APHIS

3.2.4 Technology, Infrastructure, Funding, and Staffing-Related Objectives and Implementation Tasks for Border

Objective-	Objective—BorTifs1. Build Staff and Funding Capacity to Enhance Biosecurity at Ports and Harbors				
BorTifs1	Implementation Tasks	Timeline	Lead Agency	Partnering Organization	
BorTifs1.1	Double HDOA's current PQ staff from 91 to 182 over the 10-year period of the plan to meet current and future needs for inspection services at all ports of entry. Adjust pay scales commensurate with positions, increasing responsibilities, and duties.	2018–2027	HDOA	DLNR DOH	
BorTlfs1.2	Increase staffing and operating funds for the DOH Vector Control Branch by adding 13 new staff members (total 33: current 20 in FY2017 plus 13 new positions) to be able to detect and respond to threats from disease vectors such as mosquitoes and diseases such as dengue, Zika, and rat lungworm.	2019–2027	DOH	HDOA DLNR	
BorTlfs1.3	Increase AI staff and resources by adding 15 new positions and operating funds to implement an expanded livestock disease detection monitoring program focused on contagious animal diseases of high consequence and exotic parasites at five ports.	2018–2027	HDOA	APHIS	
BorTifs1.4	Add four new state detector dog units (handler + dog) to intercept high-risk species difficult to detect by other methods of inspection or at ports of entry difficult to inspect with other methods.	2020–2027	HDOA	APHIS CBP OIA	
BorTifs1.5	Allocate money on a yearly basis to the biosecurity emergency response fund (see also BorPol1.4 and BorPro3.1).	2018–2027	HDOA	DLNR	

Objective-	Objective—BorTifs2. Build Infrastructure to Enhance Biosecurity at Ports and Harbors				
BorTifs2	Implementation Tasks	Timeline	Lead Agency	Partnering Organization	
BorTlfs2.1	Build one inspection facility on Oahu for inspection of high-risk commodities. Work with HDOT and the transportation industry to identify a suitable site either at an off-port location or, if space is available, at Honolulu Harbor. Work with HDOT to investigate and incorporate inspection facility needs into current and future port modernization plans.	2020–2023	HDOA	HDOT DLNR Industry	
BorTifs2.2	Build one inspection facility on Maui for inspection of high-risk commodities. Work with HDOT and the transportation industry to identify a suitable site either at an off-port location or, if space is available, at Kahului Harbor.	2022–2025	HDOA	HDOT DLNR Industry	
BorTifs2.3	Build two inspection facilities on Hawaii Island for inspection of high-risk commodities. Work with HDOT and the transportation industry to identify suitable sites either at an off-port locations or, if space is available, at Kawaihae and Hilo Harbors.	2024–2027	HDOA	HDOT DLNR Industry	

Objective-	Objective—BorTifs2. Build Infrastructure to Enhance Biosecurity at Ports and Harbors				
BorTifs2	Implementation Tasks	Timeline	Lead Agency	Partnering Organization	
BorTifs2.4	Build one inspection facility on Kauai for inspection of high-risk commodities. Work with HDOT and the transportation industry to identify a suitable site either at an off-port location or, if space is available, at Nawiliwili Harbor.	2026–2027	HDOA	HDOT DLNR Industry	
BorTifs2.5	Use state-of-the-art diagnostics technology to test for disease in imported plants.	2021–2027	HDOA	UH Industry	
BorTifs2.6	Install effective containment features (e.g., fences), attractants, and traps in the vicinity of ports of entry to help monitor for pests (see also BorPro1.6).	2020–2027	HDOA	HDOT	

Objective-	Objective—BorTifs3. Expand the Inspection Capacity to Address Ballast Water and Hull Biofouling Threats				
BorTifs3	Implementation Tasks	Timeline	Lead Agency	Partnering Organization	
BorTifs3.1	Hire one full-time position at DLNR's DAR to manage ballast water and biofouling threats.	2018–2027	DLNR	DOH EPA USCG	
BorTifs3.2	Fund equipment and licensing to support a ballast water reporting form and hull fouling and ballast water data management system to be implemented by January 2021.	2019–2027	DLNR	DOH EPA USCG	
BorTifs3.3	Hire one data management specialist to support DLNR's new ballast water and hull fouling database system.	2020–2027	DLNR	HDOA	
BorTifs3.4	Fund a grant program to implement experimental technologies for hull biofouling and ballast water treatment.	2022–2023	DLNR	DOH HDOT USCG EPA	

3.3 Postborder

Goal: Protect Hawaii from Invasive Species Already Present within the State

3.3.1 Background

In this HIBP, the term *postborder* refers to the area in which a pest is found after it has passed the point or opportunity of border inspection, whether or not it was detected. *Postborder* encompasses the policies, processes, and programs aimed at detecting, eradicating, or controlling the spread or impacts of pest plants, animals, and diseases after they are beyond the ports of entry and inspection process. Measures to address the interisland movement of pests are identified in this section.

Even the best efforts at preborder and border prevention, detection, and interception cannot intercept 100% of the species that will become invasive in Hawaii. Similarly, investing solely in preborder or prevention activities ignores the costs and impacts of pests that are already present in Hawaii and species that need active management to keep from incurring even higher costs (and possibly causing irreversible harm). Hawaii needs to continue to build and support early detection and rapid response capacities, policies, and processes that can reduce interisland movement of pests, as well as programs that control widespread pests or their impacts on the environment, public health, and the economy.

It is estimated that an organism not known to occur in Hawaii, and potentially a new pest, is detected at Hawaii's ports every day and that more than 20 insect species are introduced annually (HISC 2015, Rago and Sugano 2015). Newly arrived, incipient species may be eradicated if they are detected early enough. Established species that may have been introduced many years ago, such as strawberry guava, may require biocontrol to slow its spread. What is established on one island may be incipient on another. Between 1995 and 2003, an average of 89 additional alien species became established in Hawaii each year, and it is estimated that 300–500 of the more than 5,000 established alien species in the islands are invasive and damaging (Eldredge and Evenhuis 2003, Loope and Kraus 2009). These pests have major impacts on farmland, ranchland, native habitats, rare and endangered species, watersheds, marine and freshwater ecosystems, and they threaten or affect human and animal health and safety, aquaculture, agriculture, quality of life, tourism, and other cultural and economic resources important to the state.

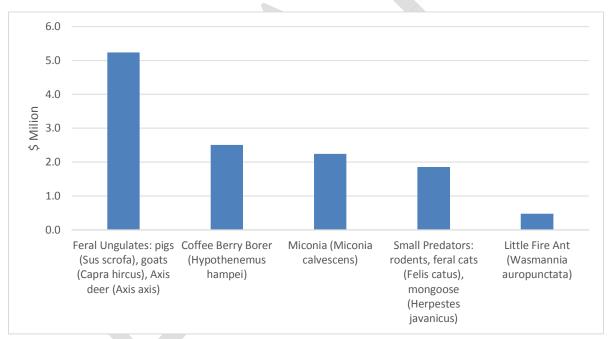

A conservation worker manually removes miconia (*Miconia calvescens*). This plant degrades forests by displacing native species in Hawaii. (Source: HISC)

A sampling of the harmful species that are the target of current control programs or that require expanded control include the mosquitoes Aedes aegypti and Aedes albopictus, which spread dengue fever and the Zika virus; the mosquito Culex quinquefasciatus, which carries the parasite that causes avian malaria; the new strain of Ceratocystis fimbriata, a fungus that causes Rapid Ohia Death, which kills ohia (Metrosideros polymorpha) and damages watersheds on Hawaii Island; feral ungulates, including feral pigs (Sus scrofa), goats (Capra hircus), and axis deer (Axis axis), which damage watersheds and agricultural crops; small predators, such as rodents and mongoose (Herpestes javanicus), which prey on native animals; coffee berry borer, which reduces the quality and value of coffee beans; marine algae and snowflake coral (Carijoa riisei), which invade, overgrow, smother, and kill coral reefs statewide; little fire ant, which threatens agriculture, quality of

life, and tourism; albizia (Falcataria moluccana), which threatens public health and safety and native forests; and other invasive plants like miconia, and strawberry guava, which outcompete and replace native forests and reduce the capture and recharge of fresh, clean water. The lost agricultural production, lost ecosystem services,

and the cost of control, as well as the impacts on our lifestyle and culture associated with invasive species such as these, have a large impact on our economy and well-being.

Postborder biosecurity in agricultural and natural systems primarily falls under the invasive species or disease control programs of HDOA, DLNR, and DOH and the research, agricultural extension, and conservation programs at UH. Federal agencies, such as USFWS, the National Oceanic and Atmospheric Administration (NOAA), USFS, USGS, NPS, the Natural Resources Conservation Service, and DOD, control invasive species on their lands and/or provide direct and technical assistance, research, and funding to state and private partners for their efforts. These front-line agencies spend millions of dollars annually to control established pests in agricultural lands, watersheds, and native habitats and to protect other important cultural and economic resources (Rago and Sugano 2015). Other state agencies, county governments, conservation groups, and many private landowners also have programs to manage invasive species on their lands. Many of the county, state, and federal agencies provide grants to help public and private landowners control and manage invasive species on their lands. The state grant programs consistently receive far more requests for funding than they have funds to award (DLNR 2015).

Amounts spent by state agencies in 2014 on control of the five most costly invasive species in the state. (Source: Rago and Sugano 2015)

The UH's island-based Invasive Species Committees (ISCs) also play an important role in the control of invasive species. They function as informal multipartner committees that can work with a variety of funding sources and across landownership boundaries and agency jurisdiction to provide rapid response and control services for incipient pests (Kraus and Duffy 2010). Similarly, the Watershed Partnerships field crews that control ungulates, weeds, and invasive species on private and public forestlands on all islands. HAL provides technical expertise, direction, and field support for the detection and control of invasive ants. All these agencies and

partners are engaged in some aspect of invasive species control and demonstrate the multiagency scope and collaborative approach described in this plan.

An additional line of defense in the efforts to control invasive species is the private pest control industry. Private industry often takes over after government programs end and responsibility for control passes to the private landowner. These operations often require specialized licensing for use of toxicants for pests such as termites or little fire ants or toxicants used in conservation areas. Finding ways to support industry and safely streamline regulations so that private industry can operate more efficiently will assist all our efforts to control invasive species in urban areas, on crop and noncrop rural lands, and on conservation lands.

This HIBP identifies policies, processes, and resources to support three strategies for limiting and controlling the impacts of invasive species. These strategies are (1) early detection, rapid response, and eradication of incipient populations; (2) containment in localized area or on a single island; and (3) long-term pest management of islandwide or statewide pests. Early detection, rapid response, and eradication involve authorities, programs, and response capabilities of HDOA, DLNR, DOH, UH, ISCs, HAL, UH's CTAHR, as well as federal partners, including APHIS, USFWS, and NPS, to detect and attempt to eradicate pests and diseases before they become established. This HIBP identifies the resources that state agencies need to support staff and rapid response capacity statewide.

Containment, which includes interisland control, involves HDOA, DLNR, DOH, UH, Watershed Partnerships, ISCs, HAL, and industry using their authority, programs, and response capabilities to attempt to prevent the spread of invasive species. It also involves working with producers and industries that ship high-risk commodities interisland and inspecting their cargo. Long-term pest management and resource protection requires the participation of HDOA, DLNR, UH, and Watershed Partnerships; federal partners, including USFWS, NOAA, USFS, and NPS; and private industry and landowners. Long-term pest management falls mostly on land managers, both public and private, and this HIBP identifies tasks to support and develop tools for private and public land managers and landowners. Tasks include HDOA biocontrol projects, control of pests in the critical habitat of threatened and endangered species and protected areas, removal of invasive algae from coral reefs, and control of predators. Challenges related to implementing these strategies and the HIBP objectives and implementation tasks identified to meet these challenges are discussed further below.

The large number of invasive species and their distribution across many different habitats and landowners presents difficult challenges for public and private landowners to control pests and protect important lands and resources. Many public landowners manage protected areas that are open to commercial and recreational uses and are at risk from the introduction of invasive species through commercial and recreational activities. Changes in rules to prevent the introduction and spread of invasive species into protected areas is needed. Similarly, protected aquatic habitats are at risk from the spread of AIS, and stricter regulation of the importation, sale, husbandry, and distribution of high-risk AIS is needed (PosPol2). The ability to control invasive species on private and public lands is also a critical issue, and amending laws or rules to enable HDOA staff to enter private property when necessary to control an invasive species is needed (PosPol2). Currently, if a landowner

denies access, HDOA can go to court and obtain a warrant to enter the property for control purposes. However, that process is slow and ineffective in many control situations. The HISC also has authority to delegate private property access as part of its statute, but first it needs to develop administrative rules that include a list of invasive taxa for control or eradication.

Another policy action that would help to protect public and private lands is streamlining the administrative process to implement or extend interim rules to impose quarantine restrictions on organisms that pose a biosecurity threat (PosPol2). Currently, the one year limit for interim rules will often end before a final rule is completed, and the protections provided by the interim rule lapse.

Detecting and controlling invasive species across a large landscape present difficult challenges. There is often limited technology, infrastructure, funding, and staffing to control wide-spread established pests. Agencies and landowners need to work together to be effective. Cooperative approaches that are needed include statewide surveillance and monitoring programs to enable early detection of and rapid response to new infestations (PosPro1); working with partners to write species-specific and generic emergency response plans (PosPro3); supporting the statewide Watershed Partnerships to assist private and public landowners to control invasive species on their lands; and supporting ISCs and HAL to fill gaps in response capacity at the county level to control high-risk and incipient populations of invasive species on private and public lands (PosPro1). To provide a more established presence for the ISCs and HAL in the biosecurity program, their funding and organizational structure should be institutionalized in the UH system. Currently, ISCs and HAL exist as research and management programs under PCSU at UH, and this HIBP includes a task to institutionalize funding and organizational structure in UH.

Greater coordination amongst agencies in administrative measures can also help to control the spread of established pests and prevent damage to important areas. Writing best management practices for control of invasive species that agencies, industry, and private individuals can follow (PosPro1) will give individuals and agencies useful tools they may implement. Additionally, incorporating those standards into Hawaii Environmental Policy Act/National Environmental Policy Act (HEPA/NEPA) reviews, permit and project

reviews, and state contracts (PosPro3) will set requirements that would be enforceable.

Management of AIS presents similar difficulties as with terrestrial systems. New species are continually arriving, and there is often limited technology, infrastructure, funding, and staffing to control widespread established pests, and the logistical challenges of working in marine environments add complexities. Agencies and community partners need to work together to be effective. Cooperative approaches that are needed include coordinating survey and monitoring efforts among the various public and private agencies and

Hawaii Division of Aquatic Resources diver using super sucker to remove invasive algae. (Source: DAR)

organizations conducting early monitoring for AIS; writing protocols to deal with tsunami and other floating debris after it reaches Hawaii shores; increasing state agency efforts and supporting local community efforts to control and eradicate AIS. Using mechanical removal and native grazers to control invasive algae on at-risk reefs statewide; investigating successful AIS vector control programs in other states and countries; and raising standards for aquaculture and point-of-sale facilities that keep, propagate, and sell imported aquatic species, to minimize chances of release into the wild (PosPro4) are a few strategies identified to control AIS. These programs will require additional funding to implement (PosTifs1).

These expanded efforts to control established terrestrial species and AIS require more resources than is currently being provided. Additional resources for ongoing mechanical and chemical control of invasive species in watersheds, on state lands, on farms and ranches, and in neighborhoods and communities was identified as a major need in meetings with agencies, during stakeholder workshops, and in recent reports (Loope and Kraus 2009, DLNR 2015, HDOA 2015, Rago and Sugano 2015). Some pests are beyond the threshold to eradicate or cost effectively control. Biocontrol is recognized as a key tool for managing established invasive species, particularly insects and the most damaging weeds (Loope and Kraus 2009, HISC 2015). Current facilities for the PPC Branch, including biocontrol research facilities, are outdated and not fully equipped.

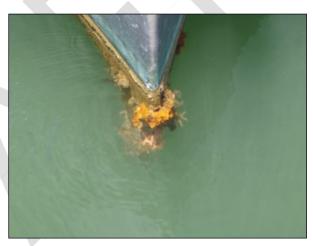

The parasitic wasp (Aroplectrus dimerus) was released and is effectively controlling invasive nettle caterpillars (Darna pallivitta) in Hawaii. (Source: HDOA)

To address gaps in staffing in its invasive species control program, HDOA will need to triple the staffing in its PPC Branch; double the size of HDOA's Biological Control Section staff; and build a new office complex, laboratories, and research facility for chemical/mechanical control and biocontrol efforts. HDOA also will update its Animal Industry Division offices and laboratories to monitor and control high-risk animal diseases. HDOA will also need to add new staff members to coordinate statewide surveillance and monitoring programs for high-risk pests, and add operating funds for these programs.

DLNR likewise has technology, funding, and staffing needs that it must meet to expand its control programs and fill gaps in its terrestrial biosecurity program (PosTifs1). Additional staffing needs include forest health specialists and a forest pathologist to monitor, detect, and manage high-risk pathogens like Rapid Ohia Death. DOFAW manages more than 800,000 acres of forests, and expanding its monitoring of insects and disease threats is critical to protect watersheds. To detect, monitor, remove, and control invasive species in all state-protected areas, including forests and watersheds, additional field crews will be needed. Extending support to private landowners who manage critical watersheds and native species habitat to assist with invasive species control, is a strategy that will enable more regional approaches to invasive species control (PosTifs1, PosTifs2).

A great deal of the support that goes directly to farmers and ranchers in rural communities to help them manage and control invasive species on their properties comes from UH agricultural extension programs in CTAHR. Providing assistance to county farmers and ranchers was identified as a gap in the workshop. Hiring additional UH agricultural and aquaculture extension agents, extension specialists, and researchers both to help control pests on farms, nurseries, and ranches and in surrounding areas and to develop screening and quarantine protocols tailored to Hawaii's needs addresses that gap. Hiring diagnosticians to provide insect and disease identification services for the program will also provide critical support services and is needed. UH also can help county government efforts to support the agricultural community by providing cooperative agreements for its extension agents or ISC staff members to work directly on invasive species control initiatives of concern to the county and work directly with county farmers and ranchers. Another major initiative for the UH is to create and fund positions for ISCs' staff in the university system, which will institutionalize the role of ISCs in the biosecurity program.

A major gap identified during stakeholder meetings was the threat that invasive species introduced to one island would spread to other islands. There is great concern that Rapid Ohia Death on Hawaii Island will spread to the other islands; that the coffee berry borer on Hawaii Island and Oahu will spread to Kauai, Maui, Molokai, and Lanai; that the coconut rhinoceros beetle, in spite of its limited distribution and the ongoing eradication efforts on Oahu, might spread to other islands; and that the little fire ant will continue to spread throughout the state. Similarly, the current interisland movement of commercial and recreational vessels that are encrusted with hull-fouling organisms facilitates the spread of AIS between islands. DAR

The bow of a ship with attached marine organisms. The most common pathway for the introduction of alien marine and harbor species is from hull biofouling, followed by ballast water. (Source: DAR)

identified vessel biofouling as the most common pathway for the introduction of alien marine and estuarine species (DLNR 2016).

This HIBP identifies a combination of policy actions, program developments, and staffing and resource increases to prevent the interisland spread of invasive species between islands (PosPol1, PosPro2, PosTifs1). In the near term, a key strategy to achieve this goal will be to focus on preventing known risks from moving between islands, rather than identifying all biosecurity risks associated with interisland transport. Needed revisions to policy include passing statutes and rules to authorize HDOA to screen and inspect nonagricultural commodities (the agency already has limited authority to inspect some agricultural products) in interisland transport, amending rules for stricter regulation of interisland movement of pests and pathogens, regulating the interisland movement of soil, and requiring the use of the emanifest system to track and screen products in interisland shipments (PosPol1). The emanifest system should be designed to be user friendly for the public and industry and should focus on identifying known risks to target for inspection efforts. The plan also includes

a policy task directed at preventing the inadvertent movement of marine invasive species by establishing new laws and rules that require both commercial and recreational watercraft moving between islands to be free of hull-fouling organisms and implementing and using a system to track and report compliance (PosPol1).

Invasive species are found on different islands and affect different resources and therefore fall under different agency jurisdictions. For these reasons, invasive species issues are multiagency, cross-sector issues with no single agency acting as the lead. Currently, invasive species are addressed by a complex set of programs housed in different agencies with a mix of inadequate funding sources. Although the HISC was established to coordinate among these programs, the current structure of the HISC does not provide dedicated staffing or funding, nor does it provide a process for nongovernment (e.g., industry) representation on the HISC. A policy initiative in the plan is establishing an autonomous Hawaii Invasive Species Authority, with additional board seats for industry and subject matter experts, to resolve these organizational and coordination limitations and give industry a seat at the table to help develop ways to more effectively control invasive species, streamline regulatory processes, and work together on common goals. The plan also includes funding support for staffing and a competitive grant program to support projects that fill gaps in other agency programs (PosPol2, PosTifs1).

HDOA's Animal Industry Division manages animal disease detection, screening, and control of outbreaks in the state. Management activities for the program include surveys for the presence of diseases of high concern (brucellosis, pseudorabies, tuberculosis) and effective response and control if they are detected. Animal Industry Division inspectors and veterinary medical staff members have responsibilities to protect animal and public health and engage with producers to promote good animal husbandry practices in order to prevent and control disease outbreaks and enhance local food security. Postborder tasks in the plan that support these objectives include using veterinary certification program data to track the movement of farm animals to prevent and control the spread of disease, developing agreements with county waste management facilities to accommodate disposal of diseased carcasses in the event of a disease outbreak, and providing updated office and laboratory facilities for the administration of the program and investigation of animal diseases that affect food security and human health.

Specific objectives and implementation tasks related to policy, process, and infrastructure and funding resources needed to enhance postborder security in Hawaii are listed below.

3.3.2 Policy-Related Objectives and Implementation Tasks for Postborder

Objective—PosPol1. Enact or Reform Policies Governing Interisland Transport of Commodities and Movement of Invasive Species						
PosPol1 Implementation Tasks Lead Partnering Agency Organization						
PosPol1.1	Propose for enactment necessary legislative amendments to HRS § 150A-5 (and other related sections) to authorize HDOA to screen, inspect, and regulate nonagricultural commodities in interisland	2017–2019	HDOA	HDOT DLNR AG HISC		

	Objective—PosPol1. Enact or Reform Policies Governing Interisland Transport of Commodities and Movement of Invasive Species				
PosPol1	Implementation Tasks	Timeline	Lead Agency	Partnering Organization	
	transport and amend corresponding administrative rules (HAR Chapter 4-72).				
PosPol1.2	Propose for enactment the necessary legislation (see also PrePol2.1 and PrePol2.2) and regulations (HAR Chapter 4-72) to authorize HDOA to require the use of the emanifest reporting and data management system for interisland shipments.	2017–2019	HDOA	HDOT DLNR AG HISC	
PosPol1.3	Develop a comprehensive approach to minimize the interisland movement of plant pathogen and pests via the interisland transport of agricultural products. This could include one or more mechanisms, such as amend and update HAR Chapter 4-72 for stricter regulation of interisland movement of pests and pathogens, enter into compliance agreements, or develop an interisland nursery certification program (see also PosPro2.2).	2020–2021	HDOA	DLNR UH AG	
PosPol1.4	Revise HDOA or DLNR rules, HAR Chapter 4-71 and HAR Chapter 13-124, and corresponding lists pertaining to nondomestic animals and injurious wildlife, to regulate movement of injurious wildlife and set up a permit process to allow legal interisland transport of pets classified as injurious (e.g., parrots).	2022–2023	HDOA DLNR	AG	
PosPol1.5	Amend HAR Chapter 4-72 to regulate the interisland movement of soil.	2020–2021	HDOA	AG	
PosPol1.6	Propose for enactment the necessary legislation and regulations (HAR Chapter 13-76) to require vessels and waterborne equipment >5 feet long to conduct and document proper hull husbandry management before being moved or shipped between islands (see also BorPol1.3).	2020–2021	DLNR	HDOT USCG HISC	

Objective—PosPol2. Improve State Statutes, Rules, and Policy to Manage Invasive Species Already Present in Hawaii				
PosPol2	Implementation Tasks	Timeline	Lead Agency	Partnering Organization
PosPol2.1	Propose for enactment the necessary legislation and regulation to restructure the HISC as the Hawaii Invasive Species Authority, an autonomous interagency body to manage and administer biosecurity programs.	2017–2019	HDOA	DLNR DOH HISC
PosPol2.2	Amend HRS §150A-9.5 to streamline the administrative process to implement or extend interim rules to impose quarantine restrictions on organisms that pose a biosecurity threat.	2018–2019	HDOA	AG
	Key issues to address: establish criteria of what constitutes an invasive species of "substantial risk" for quarantine purposes, extension of interim rules,			

in Hawaii	–PosPol2. Improve State Statutes, Rules, and Policy to Ma	ı ı ı ı ı ı ı ı ı ı ı ı ı ı ı ı ı ı ı	o opecies r

PostTifs1	Implementation Tasks	Timeline	Lead Agency	Partnering Organization
	areawide control (and prevent the reintroduction) of pests on farms, nurseries, and ranches. Support collaborative efforts to control those targeted pests on farms and in the surrounding areas.			DOH County
PosTifs1.9	Hire two aquaculture extension agents, one extension specialist, and one researcher to conduct research, develop screening and quarantine protocols, develop pest management strategies, and conduct outreach specific to Hawaii.	2018–2027	UH	HDOA DLNR
PosTifs1.10	Hire four agricultural diagnosticians to provide for rapid screening, diagnostic testing, and identification of insects and diseases to support extension agents, farmers and ranchers, the general public, and other government agencies in monitoring, detection, and pest management efforts.	2018–2027	UH	HDOA DLNR
PosTifs1.11	Increase DLNR's AIS program funding by \$400,000 per year to address threats from established AIS (see also PosPro4.2).	2018–2027	DLNR	UH NOAA USFWS HDOA HDOT
PosTifs1.12	Hire four forest health specialists and one forestry pathologist to conduct monitoring, detection, and control for high-risk pests and pathogens in forest habitats (e.g., Rapid Ohia Death, ohia rust, myoporum (naio) thrips [Klambothrips myopori], lobate lac scale [Paratachardina pseudolobata], hala scale (Thysanococcuspandani).	2018–2027	DLNR	UH HDOA USFS
PosTifs1.13	Develop grant programs to assist private landowners with invasive species removal and control. Hire one grant program technical staff member to oversee the program and annual grant funding.	2018–2027	DLNR	HDOA USFS
PosTifs1.14	Hire 45 invasive species technicians plus operational support and purchase vehicles to be used to detect, monitor, remove, and control invasive species in DOFAW's protected areas.	2018–2027	DLNR	UH HDOA USFS
PosTifs1.15	Hire a biological control program coordinator plus operational support to help increase public support for biocontrol, assist with the regulatory process for biocontrol agents, and coordinate international activities that may be of benefit and impact Hawaii.	2020–2027	HDOA	USFS ARS Australia New Zealand

Objective—PosTifs2. Develop Infrastructure and Technology to Control the Spread of Established Invasive Species				
PostTifs2	Implementation Tasks	Timeline	Lead Agency	Partnering Organization
PosTifs2.1	Build new office complex to house the PPC Branch, which will include new biocontrol program facilities and chemical/mechanical pest control facilities. The new campus will include containment facilities sufficient to run 10 parallel biocontrol projects at one time, diagnostic laboratories, molecular diagnostic laboratories, insectaries, pathogenrearing facilities, greenhouses, office space, chemical and pesticide storage, meeting spaces, and reference collections (insect, disease, plant and literature).	2018–2021	HDOA	USFS DLNR UH ARS APHIS
PosTifs2.2	Upgrade and update Animal Industry Division office and laboratory facilities for the investigation of animal diseases that affect food security and human health. Facilities will house a laboratory, training center, and administration and operation services and will be located at the Animals Industry office complex in Halawa Valley, Oahu.	2020–2021	HDOA	APHIS
PosTifs2.3	Annually fund research and development of detection techniques (e.g., use of drones, remote sensing, environmental DNA) for new and established invasive species.	2018–2027	DLNR	HISC UH HDOA DOH USFWS
PosTifs2.4	Annually fund the development of techniques to control established invasive species, including chemical and mechanical means and new technologies like gene drive, and support for maintaining or replacing the staff necessary to conduct research.	2018–2027	HDOA	HISC UH DLNR DOH USFWS

3.4 Public Awareness and Support

Goal: Enhance Public Awareness and Support for Hawaii Biosecurity

3.4.1 Background

Engaging the community has been shown to be a valuable way to address biosecurity concerns (Warren 2006, HISC 2014, Burnett and Coffman 2015, USN 2015), but in general the residents of Hawaii may not fully appreciate the invasive species problem or the biosecurity threats to our state (Burnett and Coffman 2015, HISC 2015, Rago and Sugano 2015). Enhancing awareness and building public engagement for a comprehensive biosecurity program are essential to gaining the support of the general public, policymakers, and industry for the program. As an additional benefit, an educated and engaged community would assist with

Making it easy to report a pest encourages public participation. (Source: HISC)

detecting and reporting on invasive species, helping to prevent their spread and establishment. Early detection and notification is the key to successful eradication. Inspectors and control staff will not always be in the right place at the right moment to achieve early detection. Having a community that is watchful and knowledgeable about how to report their detections is extremely valuable.

Much progress has been made with invasive species education and outreach. HDOA, DLNR, and DOH all have communications staff members and programs that provide information on invasive species to the public. HISC funds specific outreach projects and outreach staff in the ISCs through its competitive grant program. CGAPS has conducted public outreach campaigns and public opinion surveys on invasive

species and has a goal to continue to educate the public and decision makers regarding preventing the introduction of invasive species to Hawaii (Burnett and Coffman 2015). County ISCs distribute educational materials targeting statewide or county-specific invasive species issues (HISC 2015). Even with this concerted effort on the part of agencies and partners to inform the public, many of the participants in the workshops conducted for this plan identified outreach as one of the most important actions to include. The plan provides for many new projects, additional communication specialists staff in HDOA and the UH, and operational support to launch outreach campaigns to meet this need (PwsPro3, PwsTifs2).

One of the issues identified during the planning process as a gap is the relative lack of targeted messages for different audiences. Messaging targeted at specific audiences, including those responsible for invasive species introductions, is a critical need (DLNR 2003, HDOA 2007, Hauk et al. 2009). Targeted messages to the agricultural industry, conservation groups, and interested communities can develop partnerships to facilitate the prevention and control of invasive species (PwsPro3). Similarly, Hawaii lacks an aggressive and organized effort to make visitors aware of the invasive species issue, problem, and regulations in Hawaii, so most visitors are unaware that they are a part of the pest introduction problem (Warren 2006, DeNitto et al. 2015). Key strategies identified during the planning process include developing a campaign targeted at visitors. Done in collaboration with the Hawaii Tourism Authority (HTA), the campaign would target visitors before their arrival, in flight, and during their stay with key messages, including the importance of biosecurity to Hawaii (PwsPro3). The campaign would include new signs and displays regarding biosecurity at airports (PwsTifs1).

Likewise, aquatic education specialists have tasks to target harbor workers, the transportation industry, and the general public with messages about harm done when live AIS are discarded (PwsPro3). HDOA Animal Industry staff would engage the veterinary medical community to participate in detection of diseases of high concern (PwsPro1). The plan also provides resources to hire communications staff members for the UH's CTAHR Office of Communications Services to create comprehensive education and outreach materials targeted at a wide range of audiences, including the native Hawaiian community, tourists, boaters, nursery growers, livestock producers, and farmers with specific invasive species messages (PwsTifs2).

Another approach to reach the public involves inspiring Hawaii residents to engage in addressing biosecurity threats (PwsPro1). Key strategies identified during the planning process include producing materials that highlight successes of the biosecurity program and presenting stories about HDOA inspectors' firsthand experience in preventing the introduction of pests to Hawaii. These materials should foster a sense of pride and encourage the public to take responsibility for protecting Hawaii's agriculture, environment, and lifestyle. Another strategy is to encourage Hawaii residents to use locally produced plants and animals rather than imports, which often harbor harmful pests

Community outreach events help educate and engage residents and visitors on biosecurity issues. (Source: CGAPS)

or disease, and to publicize and promote the use of the certified nurseries program for local products.

The successful development and implementation of a comprehensive biosecurity program require the support of the state's policymakers. An objective of the plan is to keep the state's policymakers informed of biosecurity issues (PwsPro2). Strategies to meet this objective include encouraging the native Hawaiian community and cultural practitioners to advocate for culturally based biosecurity programs and to organize and advocate for stronger and more effective biosecurity programs with their legislators, and encouraging HDOA staff to provide briefings to lawmakers on program successes.

Providing an education about invasive species in schools was identified as a needed step for greater public awareness. The Hawaii Department of Education has strict guidelines on curriculum, and it may require legislation or approval by the Board of Education for policy to require that biosecurity and invasive species issues be included in the environmental science K–12 curriculum. One policy task included in the plan is to

Involving communities in invasive species management can create a sense of pride and responsibility regarding dealing with biosecurity issues in Hawaii. (Source: CGAPS)

propose necessary legislation and work with the Board of Education to achieve this step (PwsPol1).

Promoting greater public awareness would require not only traditional methods of community outreach, such as meetings, posters, letters, and email, but also more efficient technology, equipment, and staffing (PwsTifs1, PwsTifs2). Effective outreach requires using the most up-to-date technology and tools. Some of the key approaches identified during the planning process include building a state-of-the-art pest notification and reporting system, building a comprehensive biosecurity website and portal to

provide key information to partners and the public, developing social media applications to engage the public and build support for addressing biosecurity issues, and hiring dedicated communications specialists and a natural resource economist as agency staff members to support and implement the outreach program.

Protecting the health of the public, as well as the state's livestock and poultry industries, requires a comprehensive and modern pest and disease notification and reporting system able to effectively communicate the most current information about disease occurrence and to initiate actions to prevent or control the entry or spread of pests and diseases (PwsTifs1, PwsTifs2). HDOA's Animal Industry staff needs to engage producers and the veterinary medical community to keep informed when incidences of diseases of high concern occur, provide other biosecurity and food safety notifications, and promote good agricultural practices and production of local food items (PwsPro1). If disease outbreaks do occur, successful animal disease containment rests on the foundation of good, swift communication of risk in the affected industry and to the general public. Timely notification of disease occurrence in the community greatly influences the final cost of containment, eradication, and recovery (PwsPro3). Development and use of a variety of communication tools, such as social media, industry newsletters, and industry websites, will provide the staff with the tools to more effectively protect the animal livestock industries and safeguard public health (PwsPro1 and PwsPro3).

Specific objectives and implementation tasks related to policy, process, and infrastructure and funding resources needed to enhance public awareness and support in Hawaii are listed below.

3.4.2 Policy-Related Objective and Implementation Tasks for Public Awareness and Support

Objective—PwsPol1. Develop Relevant Policy and Rules to Enhance Public Awareness on Biosecurity and Invasive Species Issues in Hawaii					
PwsPol1	Implementation Tasks	Timeline	Lead Agency	Partnering Organization	
PwsPol1.1	Propose for enactment the necessary legislative amendment or clarification (e.g., clarification of existing authority under HRS §150A-53), and obtain the approval of the Board of Education for policy to require biosecurity and invasive species issues to be included in the environmental science K-12 curriculum in Hawaii. Build on existing efforts of integrating invasive species into curriculum, such as the Hoike o Haleakala curriculum.	2022–2023	DLNR	DOE UH HDOA HISC	

3.4.3 Process-Related Objective and Implementation Tasks for Public Awareness and Support

Objective—PwsPro1. Inspire Hawaii Residents to Engage in Solutions to Biosecurity Threats					
PwsPro1	Implementation Tasks	Timeline	Lead Agency	Partnering Organization	
PwsPro1.1	Collect pertinent examples and publish stories highlighting biosecurity successes (e.g., notable	2018–2027	HDOA	CGAPS UH

PwsPro1.2	Contract a professional public relations firm to produce outreach materials to encourage residents to buy local products, and foster a sense of pride and self-responsibility in protecting Hawaii's agriculture, environment, and lifestyle. Have HDOA inspectors share firsthand experience on protecting Hawaii from pests.	2018	HDOA	UH DLNR CGAPS Industry		
PwsPro1.3	Coordinate with partners in the industry, and use their existing media avenues, such as internal newsletters, cooperative association meetings, social media, and websites, to share biosecurity information, send pest and disease notifications, and muster support.	2017–2027	HDOA	Industry UH DLNR CGAPS		
PwsPro1.4	Recruit a network of citizen scientists and other important and competent contributors, and provide logistics and administrative support to develop a citizen science-based comprehensive surveillance system for pests and pathogens.	2018–2027	HDOA	DLNR DOH UH		
PwsPro1.5	Publicize and promote the certified nurseries program by posting information on HDOA's website on what nurseries, farms, and shippers are certified and information if participants lose certification.	2017–2027	HDOA	Industry UH HISC CGAPS		
PwsPro1.6	Engage the veterinary medical community to enhance its role in detection of diseases and parasites of high concern, including ectoparasites, which can transmit wildlife and human diseases.	2017–2027	HDOA	Hawaii Veterinary Medical Association		

Objective-	Objective—PwsPro2. Inform the State's Policymakers on Hawaii's Biosecurity Issues					
PwsPro2	Implementation Tasks	Timeline	Lead Agency	Partnering Organization		
PwsPro2.1	Solicit support from the native Hawaiian community, including the Office of Hawaiian Affairs and the Aha Moku Council, and from cultural practitioners to advocate for culturally based biosecurity programs to ensure that natural and cultural resources are sustained for traditional and cultural practices. Encourage native Hawaiian communities to organize and advocate with their legislators for stronger and more effective biosecurity programs.	2017–2027	HDOA	DLNR DOH UH		
PwsPro2.2	Highlight program successes in briefings to lawmakers.	2017–2027	HDOA HISC	DLNR DOH		

Objective—PwsPro2. Inform the State's Policymakers on Hawaii's Biosecurity Issues					
PwsPro2	Implementation Tasks	Timeline	Lead Agency	Partnering Organization	
	Key successes to include: implementation of departmental programs and projects, pest interceptions, capture of illegal animals, biocontrol releases, and weed eradication.			UH HDOT	

	-PwsPro3. Develop an Effective and Comprehensive Edu Public of Harm from Invasive Species			
PwsPro3	Implementation Tasks	Timeline	Lead Agency	Partnering Organization
PwsPro3.1	Biosecurity communications specialist at HDOA to develop outreach materials to launch a visitor awareness campaign. Key campaign issues: importance of biosecurity to Hawaii via outreach materials to visitors before their arrival, during flights, and during their stay in Hawaii.	2018–2027	HDOA	HTA HDOT DLNR CGAPS
PwsPro3.2	Aquatic education specialist (existing position) to conduct a comprehensive campaign to prevent the introduction and spread of AIS. Key campaign issues: preventing the discard of live AIS into the environment, development of outreach materials for harbor workers and transportation industry.	2018–2021	DLNR	NOAA USFWS CGAPS
PwsPro3.3	Agency staff to provide technical assistance to community volunteer groups working to control invasive species in terrestrial and aquatic systems.	2018–2027	DLNR	NOAA USFWS UH CGAPS
PwsPro3.4	Create and disseminate through various media outlets (e.g., little fire ant video produced by the Maui Invasive Species Committee) accurate and current information to help the public understand the circumstances under which species in the state are regulated and why.	2018–2027	HDOA	DLNR DOH CGAPS
PwsPro3.5	Biosecurity communications specialist to develop tools to measure success of public awareness campaigns (that can be used to leverage future funding for biosecurity needs).	2018–2027	HDOA	DLNR DOH UH HTA CGAPS
PwsPro3.6	Biosecurity communications specialist to develop and maintain an interagency biosecurity website and portal. Key information to include: Hawaii's unique position relative to biosecurity; interagency biosecurity plan; clear guidance on regulated species at interisland, interstate, and international levels; pest reporting; and import/export restrictions.	2018–2027	HDOA	DLNR DOH CGAPS

Objective—PwsPro3. Develop an Effective and Comprehensive Education and Outreach Campaign to Inform the Public of Harm from Invasive Species				
PwsPro3	Implementation Tasks	Timeline	Lead Agency	Partnering Organization
PwsPro3.7	Help implement HISC's state-of-the-art pest notification and reporting system , and integrate it with the biosecurity online portal.	2018–2027	HDOA DLNR	CGAPS DOH UH

3.4.4 Technology, Infrastructure, Funding, and Staffing-Related Tasks for Public Awareness and Support

Objective—PwsTifs1. Enhance Funding, Staffing, and Infrastructure to Build Public Awareness and Support for Hawaii Biosecurity				
PwsTifs1	Implementation Tasks	Timeline	Lead Agency	Partnering Organization
PwsTifs1.1	Hire a full-time biosecurity communications specialist at HDOA to develop and coordinate public awareness programs for HDOA's biosecurity programs.	2018–2027	HDOA	DLNR DOH
PwsTifs1.2	Hire a full-time natural resource economist to analyze the costs of inaction on high-profile biosecurity threats and to publicize the true effects of inaction when requesting funds for biosecurity projects.	2018–2019	HDOA	UH DLNR DOH CGAPS
PwsTifs1.3	Hire a communications specialist, videographer, and web developer from CTAHR Office of Communications Services to write, develop and disseminate new statewide comprehensive education and outreach materials targeted at specific audiences, such as the native Hawaiian community, tourists, boaters, nursery growers, livestock producers, and farmers, with specific invasive species messages. The CTAHR communications team would work in close coordination with the HDOA biosecurity communications specialist.	2018–2027	UH	CGAPS DLNR HDOA
PwsTifs1.4	Collaborate with HTA to obtain funds from the visitor industry to pay for biosecurity media campaigns.	2018–2027	HDOA	HTA DLNR
PwsTifs1.5	Collaborate with HTA to contract a professional public relations firm to create visually appealing signs and displays regarding biosecurity at airports.	2018–2027	HDOA	НТА

Section 4.0 Analysis of Implementation Tasks

This HIBP identifies 152 implementation tasks that are spread across the four biosecurity program areas (preborder, border, postborder, and public awareness and support) and that represent a rough estimate of the proposed effort. Prevention actions make up the largest effort, 53% of the tasks, which represents the combined preborder (23%, 35) and border (30%, 46) actions (Figure 4.1). This allocation of effort is consistent with the basic principle of biosecurity: to focus more effort on actions to prevent the introduction of invasive species, which can in turn help avoid unnecessary and costly control efforts in the future. Control efforts, or postborder program actions, constitute 33% (50) of the tasks. Twenty-one, or 14%, of the actions identified in this HIBP relate to increasing public awareness and support for Hawaii's residents and visitors. In general, most of the tasks in each of the program areas were process related rather than policy or resource (technology, infrastructure, funding, and staffing) related (Figure 4.1).

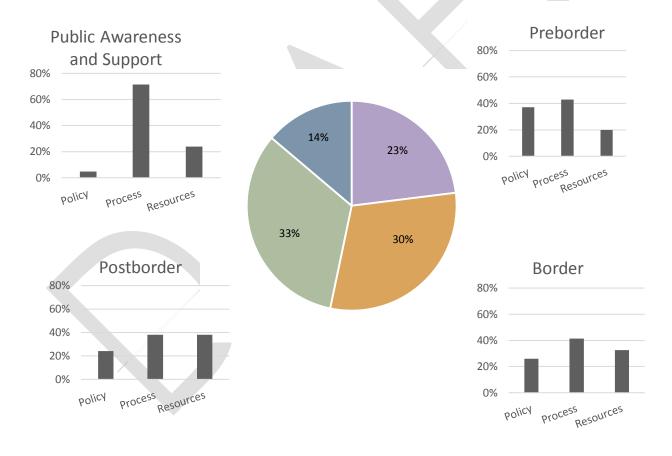

Figure 4.1. Percentage of Biosecurity Implementation Tasks by Program Area and by Type of Action

From the perspective of the type of actions, most of the tasks (68, 45%) are related to implementing new processes and program initiatives, followed by tasks to develop or secure resources of staffing, funding, infrastructure, or technology (46, 30%). The lowest number (38, 25%) of implementation tasks were policy related (i.e., related to updating protocols or administrative rules or formulating new legislation) (Figure 4.2).

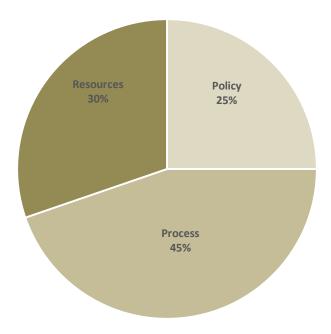

Figure 4.2. Percentage of Hawaii Interagency Biosecurity Plan Tasks by Type of Action

HDOA, as the primary agency involved in all aspects of biosecurity, is the lead on 103 tasks or is responsible for implementing 68% of the plan (Figure 4.3). Its efforts are broadly spread across all program areas, with the largest number of tasks identified in the preborder (29%) and border (30%) program areas. DLNR is the lead agency on 39 (26%) implementation tasks, which includes management of both terrestrial species and AIS programs. Its effort is also spread across all programs areas, but unlike HDOA its largest focus is on postborder (46%) control efforts (Figure 4.3). UH is the lead on seven (4%) tasks involving postborder control and public awareness and support. Its postborder actions primarily involve pest control support for agriculture through CTAHR's research and extension programs. DOH is the primary lead on two border tasks (1%) involving its vector control program and prevention of human diseases coming into the state. The counties are identified as lead on one task (1%): providing funding to UH extension programs to support pest control efforts in the farming industry in their counties. Of the 152 tasks, 11 tasks have HDOA, DLNR, UH, DOH, or county identified as coleads for implementation.

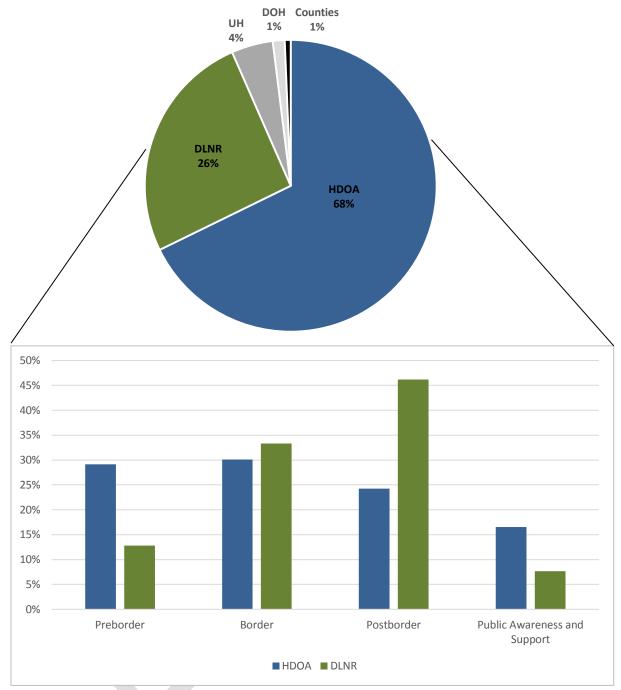

Figure 4.3. Percentage of Biosecurity Implementation Tasks by Agency and Program Area
